Document Title	Equity of access to specialised services
Job No	639
Prepared by	Beatriz Rubio Huete and Jake Parsons
Checked by	Steven Wyatt and Peter Spilsbury
Date	December 2020

Executive summary

Most health services for patients with acute conditions are commissioned and delivered locally. Some services, however, are designated as 'specialised' either because the conditions they treat are rare or because the treatment itself is especially novel or complex. These specialised services are commissioned regionally or nationally and are delivered by a small number of specialist NHS Trusts. Whilst the volumes of these services may be low in comparison to more generic acute services, they are expensive and responsible for a considerable proportion of total NHS expenditure.

The principle of equity requires that health services are distributed in line with a population's ability to benefit. Patients with similar levels of need should have an equivalent chance of accessing a service irrespective of their personal characteristics or the area in which they live. Whilst equity is a concern for all health services, it is a particular issue for specialised services which are delivered in low volumes and at a small number of geographically dispersed sites. This report assesses the extent to which specialised services are equitably distributed across the geographic sub-populations of the West Midlands.

Estimates of both service supply (to a population) and service need are required to assess equity. Detailed datasets support the measurement of the supply of many forms of specialised service. But these data are far from comprehensive. Measuring the level of need for a service is more complex. Direct measurements of need are rarely available and so proxies for population need, relevant to the specific services are commonly used instead. In this report we assess the geographic equity of 53 specialised service lines, setting out our approach for estimating both supply and need. Whilst these assessments cannot be definitive, they offer managers and clinicians a sense of the scale of this issue at hand and can guide the prioritisation of those areas and services which require the most urgent attention.

Our analysis provides strong prima-facie evidence of widespread geographic inequities in access to specialised services. Patients in some areas such as Birmingham and Solihull and Nottingham appear to be much more likely to receive specialised services than their counterparts with similar levels of need in more rural areas such as Derbyshire, Herefordshire, Worcestershire, and Lincolnshire.

We recommend that those with responsibility for commissioning and delivering specialised services consider the detailed findings in this report, confirm the prima-facie evidence with more detailed service reviews and develop plans to ensure that services are equitably distributed in future.

1. Introduction

1.1 Background

Specialised services support people with a range of rare and complex conditions. They often involve treatments for patients with rare cancers, genetic disorders or complex medical or surgical conditions. Specialised services are not available in every local hospital because they have to be delivered by specialist teams of doctors, nurses and other health professionals who have the necessary skills and experience. Unlike most forms of healthcare, which are planned and arranged locally by Clinical Commissioning Groups (CCG), specialised services are planned nationally and regionally by NHS England and NHS Improvement (NHSE&I).

Differences in the care and support patients receive in different parts of the country has long been a subject of concern to health care commissioners. The issue is of particular importance to NHSE&I as the commissioner of specialised services given the limited supply and geographic dispersion of these services.

NHSE&I (Midlands) asked the Strategy Unit to analyse the variation in provision of specialised services across the Midlands region. The primary aim of the analysis is to identify where inequity of provision or access exists at a CCG population level. Understanding the distribution of specialised services provision to patients across the Midlands is important to ensure that patients are able to access these services according to their needs and that equity of access is maximised. Identifying those areas where inequities exist will help NHSE&I and local systems to investigate and address the causes of disparities and ensure all patients have equal access to specialised services.

2. Data, Methods and Scope

2.1 Data

Specialised services are commissioned and paid for in a number of ways. A significant proportion is delivered under block contracting arrangements and, in these cases, robust and detailed activity datasets are not always available.

The Identification Rules (IRs) set out the process by which healthcare activities are identified as specialised. The data used to support the commissioning process consist of both standard and non-standard flows of various quality and content. There are four different methods of identification¹:

1. Application of technical logic against standard inpatient and outpatient data flows. The technical logic creates selection criteria based on the presence of a combination of main specialty or Treatment Function Codes, procedure and/or diagnosis codes, age of patient and name of provider organisation
2. Comparison of service provision against a list (i.e. list of high cost drugs and devices)
3. Comparison of healthcare activities against patient registries/clinical databases
4. If none of the three previous methods of identification are possible creation of local (to provider) data capture processes to illustrate patients who meet the criteria of being specialist

Given that robust and accessible datasets are not routinely available for all of the above methods this analysis considers a subset of specialised services activity that is identified by method 1 above. Whilst this may not provide a comprehensive picture of specialised services provision it does ensure that the analysis undertaken compares activity recorded on a consistent basis according to an agreed and established set of rules.

The baseline activity data used within this analysis includes all Inpatient admissions and outpatient attendances within the 2018/19 financial year that were assigned to a Specialised Services National Programme of Care (NPoC), the presence of which flags the activity as specialised based on method 1 of the IR rules outlined above. The data is drawn from the National Commissioning Data Repository.² 2018/19 data was used, since this was the latest full year of data available when the analysis began.

¹ Manual for Prescribed Specialised Services 2018/19 <https://www.england.nhs.uk/wp-content/uploads/2017/10/prescribed-specialised-services-manual.pdf>

² Tables tbl_Data_SEM_APCE and tbl_Data_SEM_OPA in the NHSE_SUSPlus_Live database.

Specialised services commissioned by NHS England have been grouped into six **National Programmes of Care (NPoC)**:

- Internal medicine – includes respiratory, hepatobiliary and circulatory system, Endocrinology, vascular disease, cardiothoracic, digestion, renal, colorectal, dermatology and rheumatology.
- Cancer – includes radiotherapy, chemotherapy and cancer surgery
- Mental health – includes adult MH, secure services, CAMHS, and perinatal MH
- Trauma – includes major trauma, spinal services, neurosciences, ear and ophthalmology, critical care and pain services.
- Women and children – includes medical genetics, childrens surgery, paediatric medicine, paediatric neurosciences, congenital heart services, metabolic disorders, Paediatric intensive care, neonatal intensive care and women’s services
- Blood and infection – includes blood and marrow transplantation, blood disorders, infectious diseases, haemoglobinopathies and immunology and allergy services.

The data considered within this analysis covers five of the six NPoC categories. (The mental health category is not included as a result of low levels of identified inpatient and outpatient activity for these programmes of care). Within each NPoC category the data is further categorised into **Clinical Reference Group (CRG) Subcategories** (covering broad areas of activity such as Respiratory services) and **Service Lines** (covering more specific activity cohorts such as activity relating to specific diseases). The analysis within this report is typically at an individual service line level.

In total there are 126 service line activity cohorts. However, a number of these have relatively low levels of activity recorded which meant that meaningful comparisons between CCGs was not possible. Service lines with more than 1,500 admissions or attendances in 2018/19 were included in this analysis. A small number of service lines were grouped together in order to reach the threshold for inclusion where it was considered appropriate to do so (i.e. clinically related service lines, which when grouped, could be meaningfully and usefully compared to a single indicator of need).

2.2 Methods

The aim of the analysis was to provide an assessment of equity of access to specialised services. Our approach was to compare activity / need ratios within service lines across CCGs in the Midlands. Activity ratios were calculated using the number of Inpatient admissions (or outpatient attendances) and an estimate of the level of need within the CCG.

Establishing the level of need for each category of specialised services is not straightforward. Whilst the simplest approach would be to use population size as a proxy indication of need this would not take account a number of factors that might affect the true level of need for a particular condition

within a particular area such as population age and sex structure, morbidity, deprivation or other factors that might impact on the level of underlying need within a locality.

Our approach was therefore to identify or derive a more appropriate indicator of need for each service line considered. To do this we reviewed a range of potential sources. These included a search of academic literature to identify prevalence studies for the patient cohort of interest, published prevalence data, national or primary care disease registries and a variety of other sources. Where specific condition prevalence or need data could not be found (or was not applicable where a service line cohort covered multiple conditions) we used other proxies for need including weighted population estimates or population age subsets. Details about the source of the need estimates used including a rationale for its use where appropriate are provided within each service line section within the detailed results.

2.3 Scope

Whilst inequity can take many forms (by gender, ethnicity, socio-economic status etc.) this analysis is concerned with geographic inequity of provision. Specifically, it identifies differences in access to specialised services between CCG areas within the West Midlands.³

The following map illustrates the geography covered and identifies the CCG's within this report.

Figure 1 Mapped CCGs

³ Our analysis may directly or indirectly adjust for sociodemographic factors that influence levels of need within CCGs (such as age, deprivation and ethnicity), but does not assess inequity within these factors.

This report considers activity at a service line level and includes those service lines with at least 1,500 admissions or attendances. The following table shows all of the services lines within each NPoC where at least one admission or attendance was recorded. Those that are included within this report are highlighted in blue (either as individual or grouped service lines).

Table 1 Activity levels by CRG sub-category and service line

Immunology	4,485	5,443	9,928

2.4 Format of outputs

The results are presented in two sections. The first provides a summary of the results, by NPoC category, illustrating for each service line whether a CCG has a high or low rate of activity relative to estimated need.

The second section provides detailed results for individual prescribed service lines. It is ordered according to the five NPoC categories and the Clinical Reference Group subcategories within each of these. The presentation of the results for each service line include:

- A description of the activity included i.e. the prescribed service line (or lines were grouped).
- A description of the need data used to calculate the activity rate including its source and rationale for its use and any pertinent issues or limitations that might affect the validity of the results.
- A funnel plot to identify CCGs that appear to have significantly higher (or lower) levels of specialised activity relative to the estimated need.
- A map locating CCGs with high or low rates and the location of providers eligible to provide specialised services of the relevant type.
- A table quantifying activity and need within individual CCGs.

Interpreting the outputs

A funnel plot can be interpreted in the same way as a scatter plot. In the example below, each CCG is represented by a dot. The position of a dot relative to the vertical axis represents the ratio of activity to need for the CCG (Activity / need ratio = activity/indicator of need). The location of a dot on the horizontal axis represents the CCG's indicative level of need. A funnel and horizontal line are superimposed on the scatter plot. The line represents the Midlands activity / need ratio. The funnel

shows the three-sigma limit for each level of need (the dotted funnel lines). If a point is outside the funnel there is a 99.7% likelihood that the difference from the regional ratio is not due to chance (i.e. there is a special cause for this variation). In the case of the two sigma limit (the dotted lines closer to the average rate), the likelihood is 95.5%.

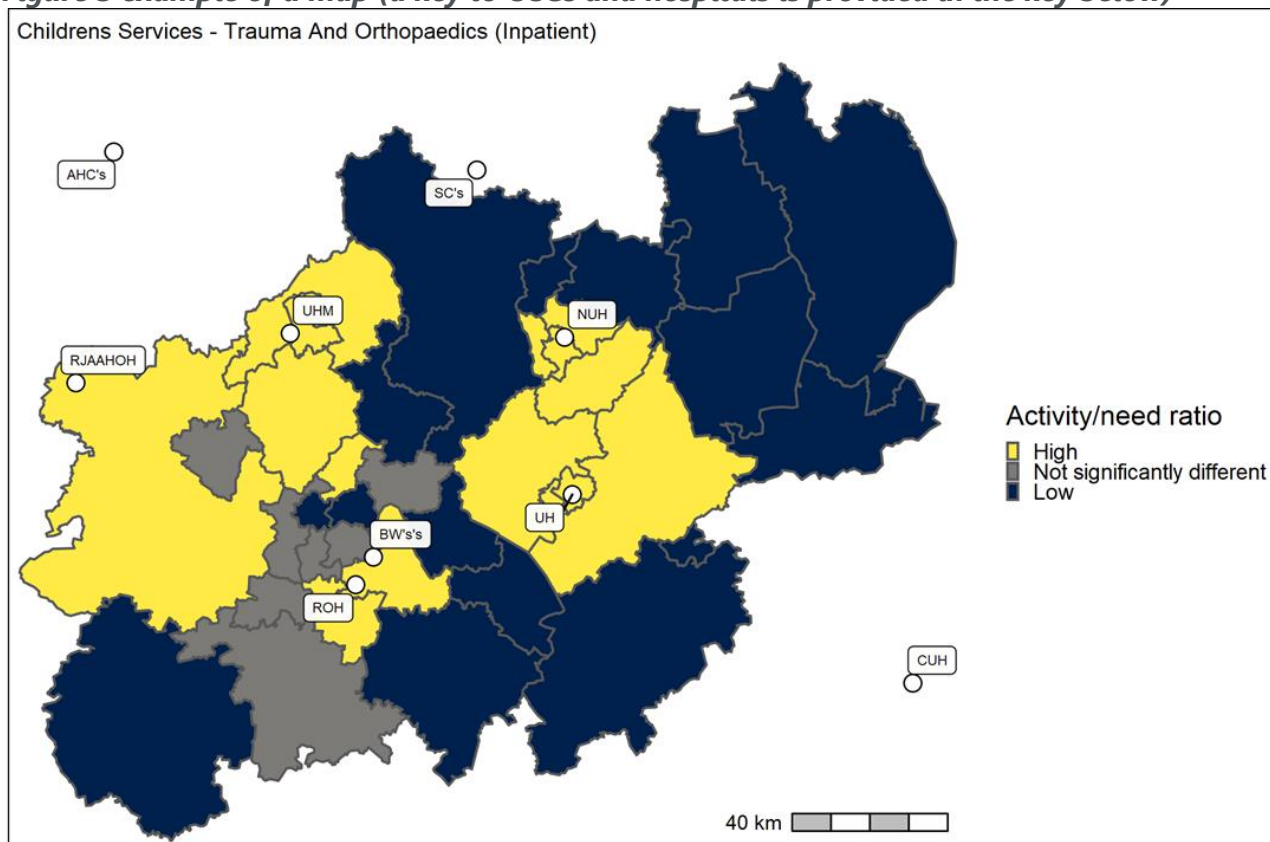

Figure 2 example of a funnel plot

The heat maps presented in this report (example below) correspond to the funnel plots and illustrate geographically those CCGs that have significantly higher or lower activity / need ratios . Some specialised services can only be delivered by specified providers, where this is the case these providers are also shown on the map.

Illustrating variation geographically may help to identify where access may be affected by proximity to specialised provision. It could also identify clusters of CCGs that may be operating differently regarding use of specialised services.

Figure 3 example of a map (a key to CCGs and hospitals is provided in the key below)

Key to specialist providers

This report quantifies and illustrates the scale of variation in access to specialised services. It identifies those CCGs that appear to have particularly high or low levels of access to specialised services given the estimated level of need. A high rate does not necessarily indicate oversupply nor a low rate undersupply. A high rate in one or more CCGs may, for example, reflect a shortage of capacity in other areas.

Further analysis or investigation is likely to be required to fully understand the causes of unequal access and the subsequent action to address it. This report provides useful information that can be used to identify and prioritise where that further work is most needed to ensure that patients received fair and equal access to specialised services regardless of where they live.

When considering service lines with apparent inequity of access there are a number of possible explanations that should be considered or investigated. Understanding these will help to inform what action is needed to address access issues. Possible explanations might include:

Data or methodological artefacts

- Data quality – for example, is all specialised activity recorded properly such that the algorithms are able to flag it as such
- Idiosyncrasies in the identification rules which may differentially assign activity as specialised in different areas.
- Indicator of need does not reflect true level of need – in many cases we have used a proxy for need which in some cases may not reflect the true level of need within an area.

Differences in referral behaviour

- Variation in local guidance relating to referrals to specialised services
- Variation in referral practices or referrer knowledge of service availability and referral process
- Propensity of consultants in non-specialist hospitals to refer or transfer patients to specialist providers

Differences in the service structures, processes or capacity

- Different approaches to the management and treatment of conditions

-
- Differences in treatment regimes such as higher frequency of follow up outpatient appointments
 - Geographically inaccessible services – long distances to access specialised services may result in lower levels of referrals or low levels of uptake
 - Lack of capacity within an area – many specialised services are provided by specialist professionals which by their nature are often difficult to recruit.

Differences in patient behaviour

- Patient's knowledge of specialised services
- Patient's willingness or capacity to demand access to specialised services
- Patients' ability to pay for travel or give up time to attend treatments.
- Patient preference in terms of trade-offs between the treatment benefits and costs or potential harms
- Patients relocating to live closer to specialised services where repeated access over a sustained period may be required

There are some specific issues relating to the way in which specialised services are identified and paid for that are worthy of note when interpreting the findings in this report. For some service lines, the identification rules (described on page 2 above) are somewhat blunt and capture a wider set of activities than might ordinarily be considered to be 'specialised'. For example, the paediatric orthopaedics service line captures all paediatric orthopaedic activity undertaken at defined set of providers. In other cases, the rules are quite specific, but deliver somewhat counterintuitive results. The rules for the interstitial lung disease (ILD) service line for example, identifies all inpatient activity where the hospital record includes a diagnosis of ILD whether or not this condition precipitated the admission. This may result in an activity being identified as specialised when the activity itself was general in nature. For other service lines, the rules contain Provider Eligibility Lists (PELs) which limit those activities which are identified as specialised with reference not only to what care is provided, but also to the provider that delivered the care. This is for example the case with specialised neurology services. In these cases, an activity delivered by a provider on the PEL might be identified as specialised, whilst the equivalent activity delivered by another provider may not. Note that this does not alter the activity that takes place but simply whether the activity is considered to be specialised and therefore whether NHSE or the local CCG are required to cover the associated costs. Such differences may at face value appear to indicate inequities in access, when in reality, the inequity lies in the funding responsibility. This, in itself, is worthy of note.

3. Summary Results

3.1 CCG and service line summary

The following charts provide a summary of the results by CCG and service line for each NPoC category.

A yellow rectangle indicates that the activity/need ratio for that CCG is significantly above the ratio for the Midlands as a whole, a dark blue rectangle indicates that the activity/need ratio is significantly below the Midlands ratio. Grey indicates the activity/need ratio is not significantly different from the Midlands ratio. A blank rectangle indicates that there was no activity data for this CCG.

Internal Medicine

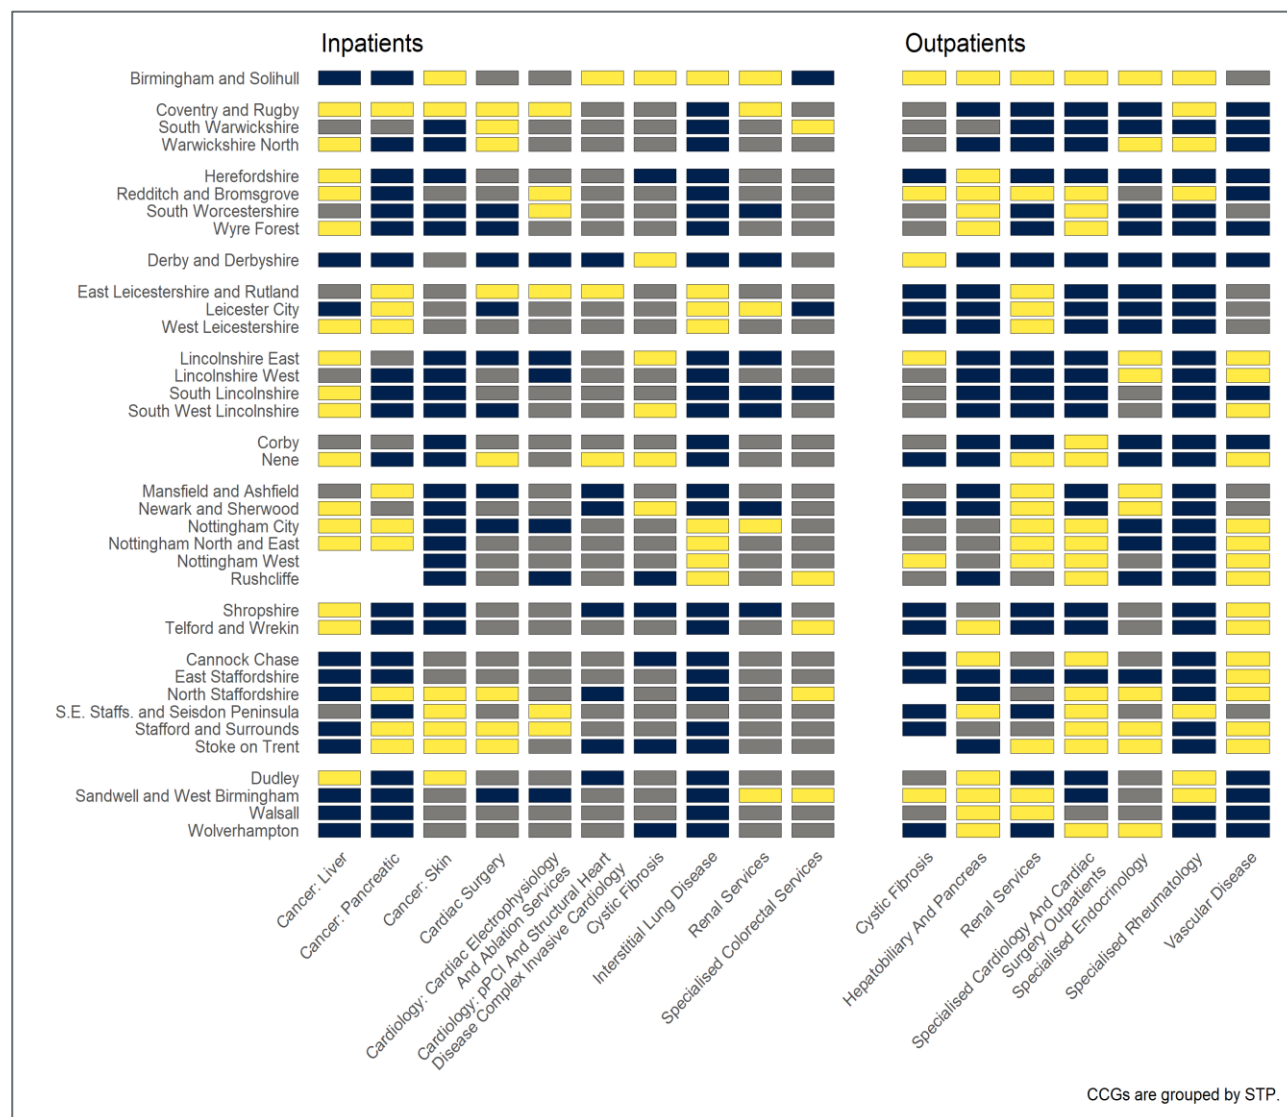

There are high levels of inequity in access to specialised internal medicine services, with notably higher levels of inequity in inpatient services for interstitial lung disease, cancer services and outpatient services for specialised rheumatology and cardiology. Lower levels of inequity were seen for inpatient services for cardiology: PCI and structural heart disease and colorectal services.

Relative to need, higher levels of specialised internal medicine services are seen in

- Birmingham and Solihull CCG

and lower levels in

- Derby and Derbyshire CCG,
- Shropshire CCG and
- three out of the four CCGs in Lincolnshire (South Lincolnshire CCG, South West Lincolnshire and Lincolnshire East CCG).

Cancer

There are high levels of inequity in access to most forms of specialised cancer services with exceptions being in urological cancer and complex thoracic surgery.

Relative to need, higher levels of specialised cancer services are seen in

- East Staffordshire CCG,
- Newark and Sherwood CCG,
- Nottingham City and
- Nottingham North and East CCG and
- East Staffordshire CCG.
-

Lower levels were seen in

- South Worcestershire CCG,
- Lincolnshire West CCG,
- South West Lincolnshire CCG,
- Shropshire CCG,
- Walsall CCG and
- Wolverhampton CCG

Trauma

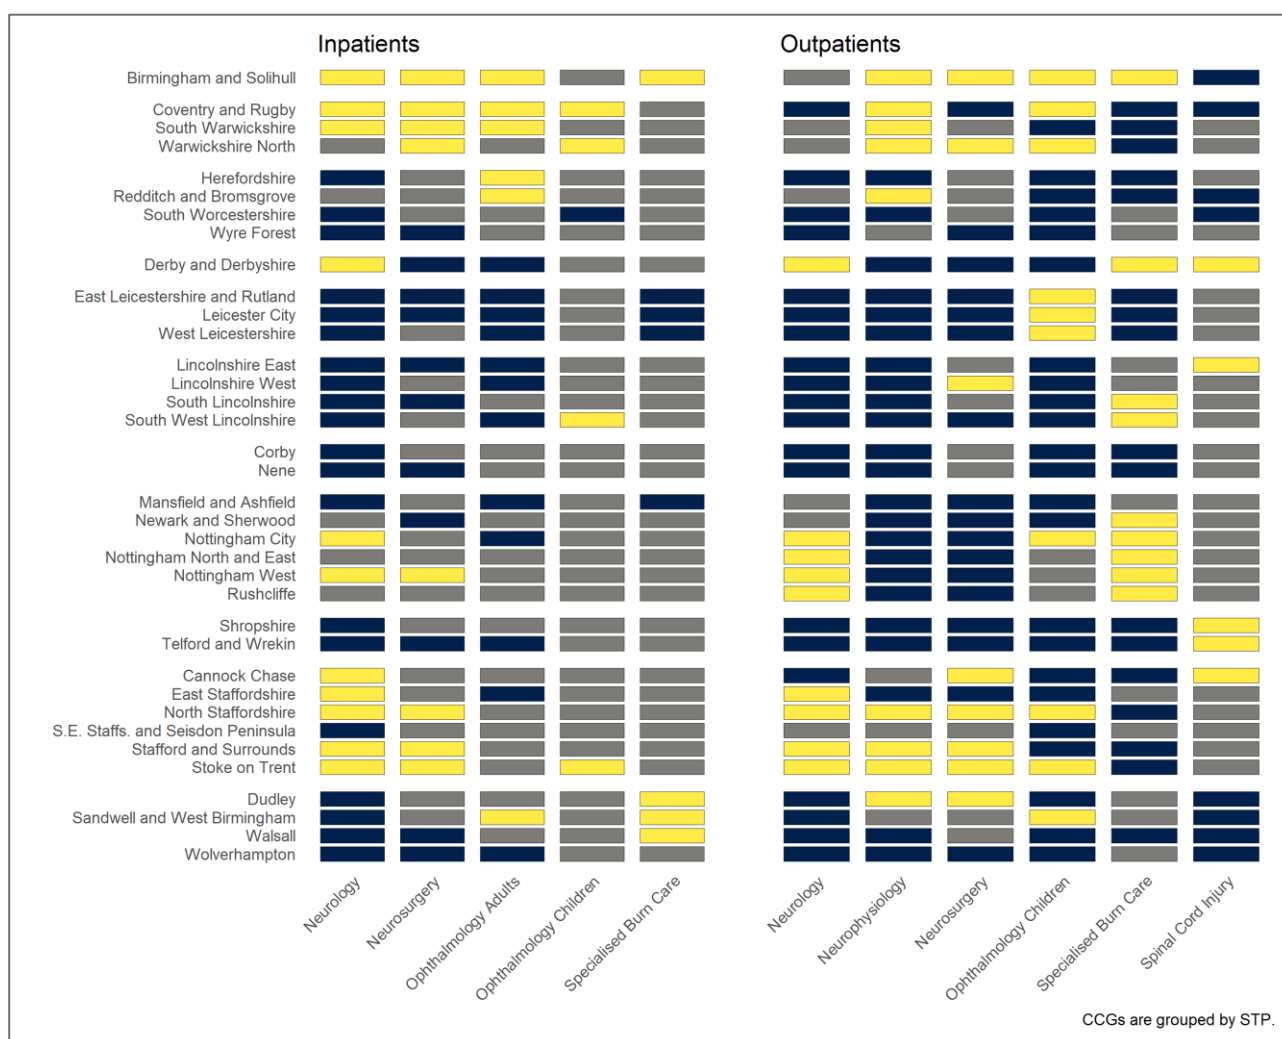

There are high levels of inequity in access to services included within the Trauma NPoC, with notably higher levels of inequity in specialised inpatient neurology services, and outpatient neurophysiology services and children's ophthalmology. Lower levels of inequity are seen in inpatient burn care services and inpatient children's ophthalmology.

Relative to need, higher levels of specialised trauma services are seen in

- Birmingham and Solihull CCG,
- North Staffordshire CCG and Stoke-on-Trent CCG and
- Coventry and Rugby CCG,
-

and lower levels in

- East Leicestershire and Rutland CCG, Leicester City CCG and West Leicestershire CCG,
- Mansfield and Ashfield CCG,
- Telford and Wrekin CCG and
- Walsall CCG and Wolverhampton CCGs.

Women and Children

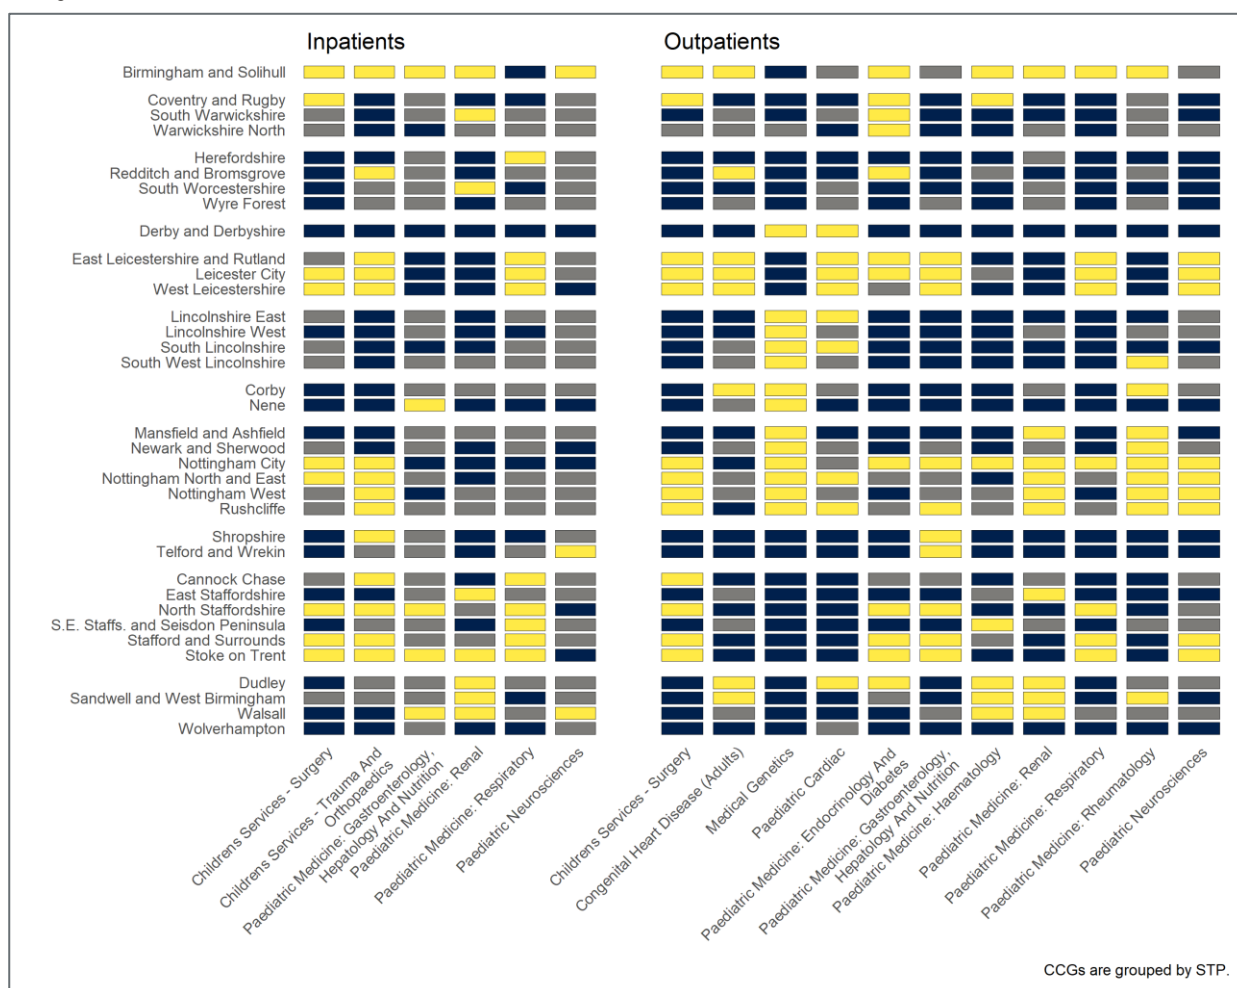

There are high levels of inequity in access to specialised services for women and children, with notably higher levels of inequity in inpatient trauma and orthopaedics, outpatient medical genetics, outpatient paediatric endocrinology, outpatient Haematology and outpatient respiratory services.

Relative to need, higher levels of specialised services for women and children are seen in

- Birmingham and Solihull CCG,
- all three Leicestershire CCGs,
- Nottingham City CCG and Nottingham North and East CCG,
- Rushcliffe CCG,
- North Staffordshire CCG, Stafford and Surrounds CCG and Stoke-on-Trent CCG,
-

and lower levels in

- all four Hereford and Worcestershire STP CCGs,
- Derby and Derbyshire CCG,
- South Lincolnshire CCG, Lincolnshire East CCG and Lincolnshire West CCG,
- Nene CCG,
- Shropshire CCG, and
- Wolverhampton CCG
-

Blood and Infection

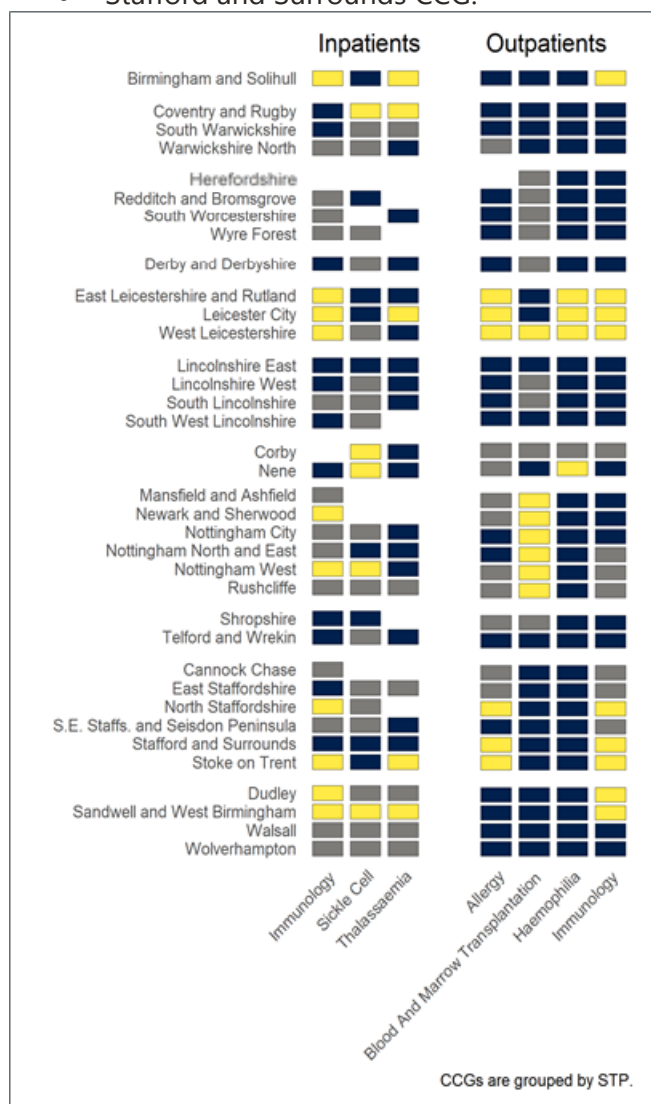

There are high levels of inequity in access to of specialised blood and infection services, with notably higher levels of inequity in outpatient haemophilia services and lower levels of inequity in inpatient services for sickle cell.

Relative to need, higher levels of blood and infections services are seen in

- East Leicestershire and Rutland CCG and
- West Leicestershire CCG
-

and lower levels in

- Coventry and Rugby CCG and South Warwickshire CCG,
- Lincolnshire West CCG, Lincolnshire East CCG and South West Lincolnshire CCG and
- Telford and Wrekin CCG and
- Stafford and Surrounds CCG.

3.2 CCG summary

Figure 4 summarises the results across all service lines by CCG. It illustrates, for inpatient and outpatient services, the **net** number of service lines where the activity/need ratio was significantly above the regional rate (calculated as the number of service lines significantly above minus the number significantly below).

Table 2 provides a more detailed quantification by CCG and STP showing how many service lines were in each group (above the regional ratio, below the regional ratio or not significantly different (NSD)).

Birmingham and Solihull CCG had very high net figures for both inpatient and outpatient service lines. By contrast a number of CCGs including Derby and Derbyshire, South Worcestershire, Shropshire CCG, Lincolnshire West and Wolverhampton all had very low net figures for both inpatients and outpatient service lines. Coventry and Rugby and South Warwickshire CCGs were unusual outliers in that they had a high net inpatient figure but a very low net outpatient figure. The subsequent table further indicates that patients in some wider geographical areas have lower levels of access to specialised services. Access to both inpatient and outpatient specialised services appears to be particularly low for patients in some of the more rural parts of the region notably Lincolnshire, Derbyshire and Hereford and Worcestershire.

Figure 4. Net inpatient and outpatient service lines where the activity/need ratio was above the regional average (service lines above average minus service lines below)

Table 4 Summary of service lines by CCG

	Inpatient Services				Outpatient Services			
	service lines above	N.S.D	Service lines below	Net	service lines above	N.S.D	Service lines below	Net

4. Detailed service line results

4.1 Internal medicine

4.1.1 Specialised Respiratory

There were three service lines within the specialised respiratory activity category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were:

- Interstitial Lung Disease (inpatient) and
- Cystic Fibrosis (inpatient and outpatient).

Interstitial Lung Disease (Inpatient)

Activity data - Inpatient admissions with (IR flag M29) Interstitial Lung Disease (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line as Interstitial Lung disease covers a range of conditions with a range of causes both natural and industrial. Since the frequency of the majority of ILDs is influenced by age, gender, ethnicity, and smoking habits^{4,5} it was decided that the General and Acute weighted population⁶ was a reasonable proxy for need in this case.

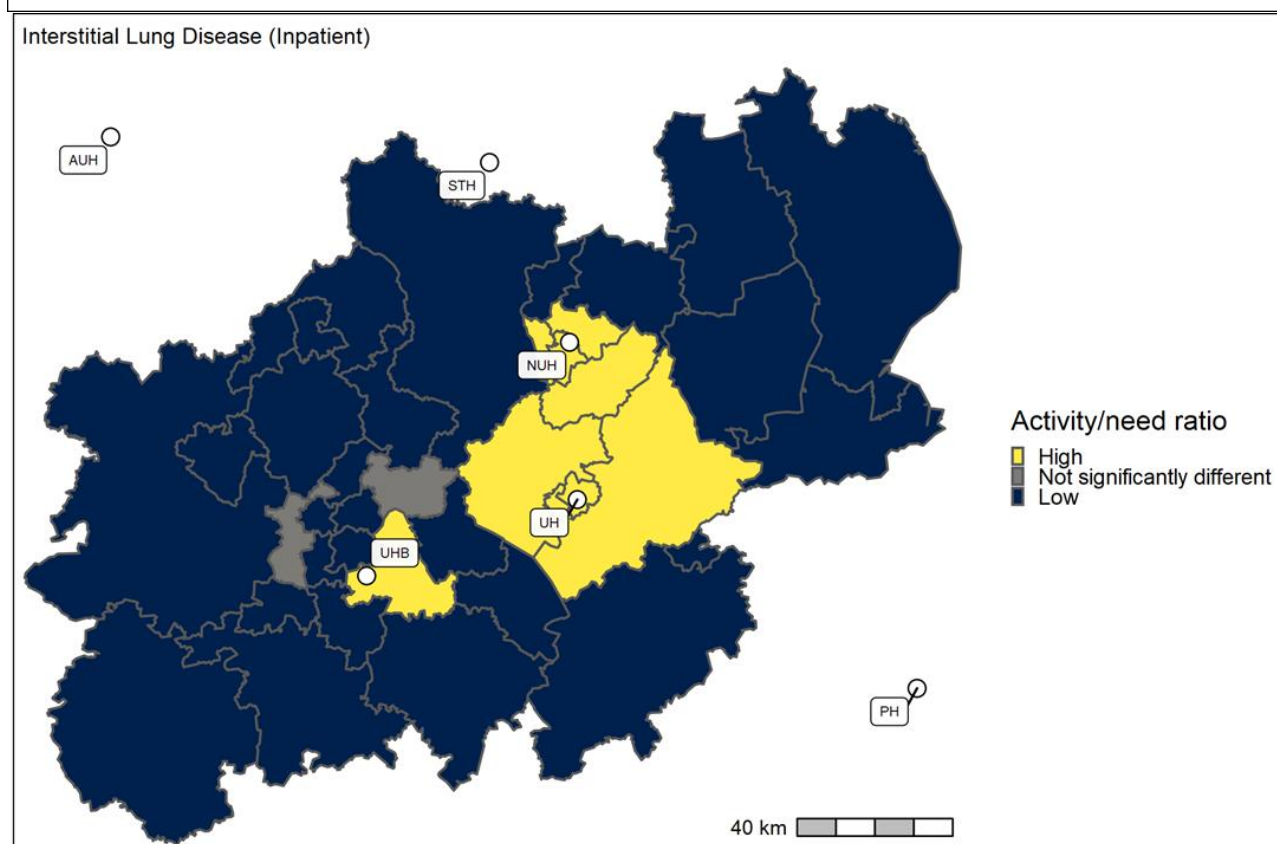

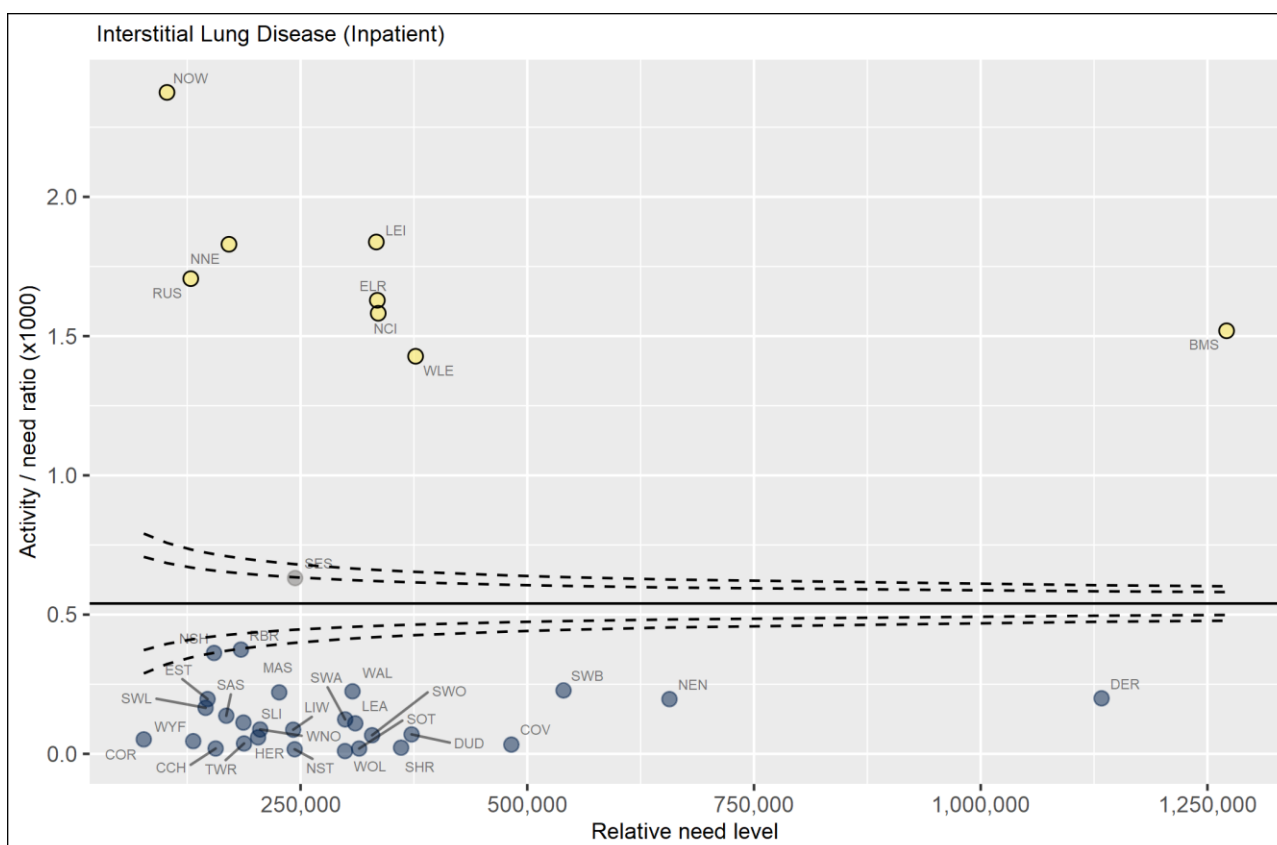

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

Cystic Fibrosis (Inpatient)

Activity data - Inpatient admissions with (IR flag 10Z) Cystic Fibrosis (2018/19).

Indicative level of need – Number of patients with an inpatient admission during the last 10 years where the primary or secondary diagnosis field contained a diagnosis code for cystic fibrosis (E840, E841, E848, E849 or P75X); source: SUS+. The rationale for this being that cystic fibrosis is a longstanding condition and most patients with the condition are likely to have required an admission during a ten-year period. Thus, identifying all patients with an admission during this period is likely to be a reasonable proxy for all patients with the condition.

Activity and need data by CCG. Cystic fibrosis (Inpatient).

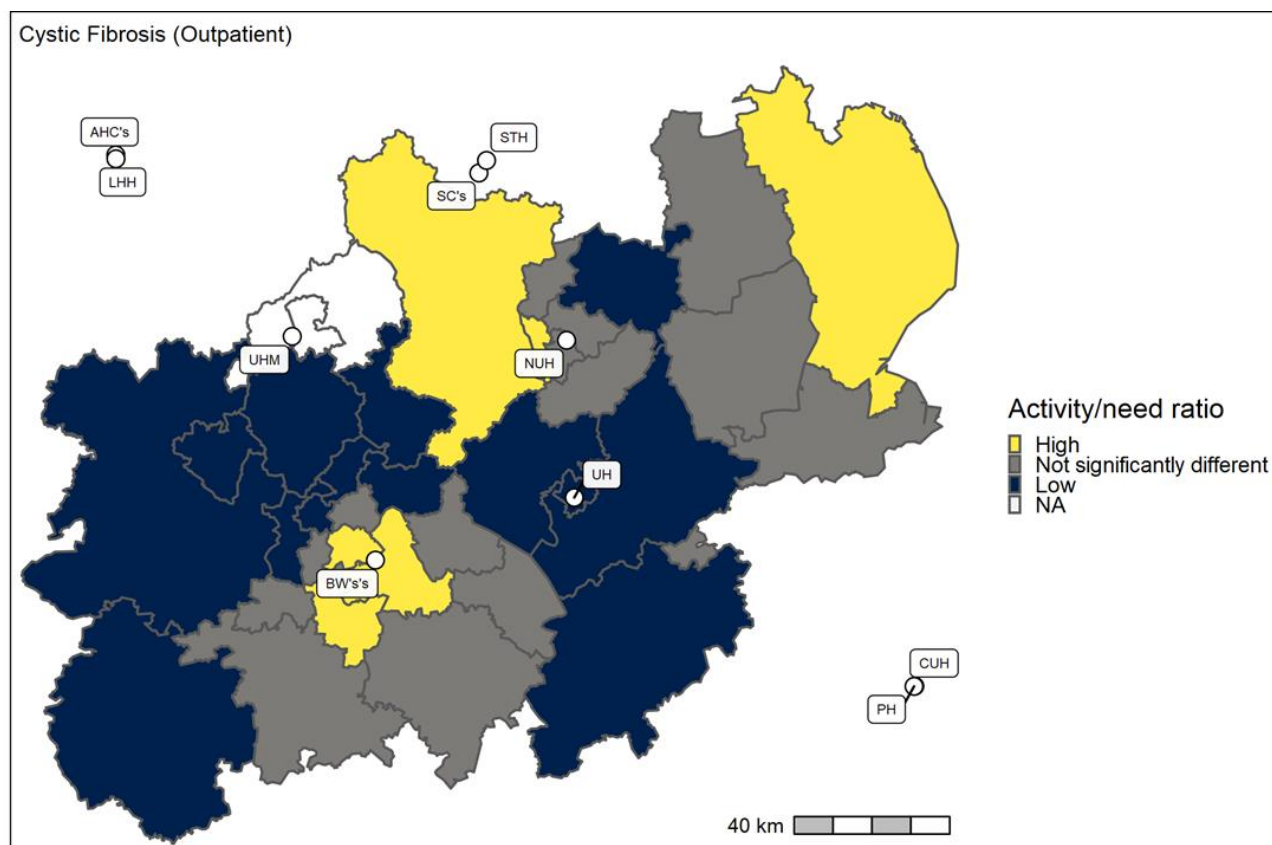

Activity ratio is per 100 need

Cancer: Pancreatic (Inpatient)

Activity data - Inpatient admissions with (IR flag 19V) Cancer: Pancreatic (2018/19).

Indicative level of need – 10 year prevalence of Pancreatic Cancer. Source: Cancer Prevalence data Public Health England 2018⁸. Long term cancer prevalence is not an ideal indicator of current need within a CCG but is considered better than a population based numerator.

⁸ Public Health England and NHS (2018). Cancer Prevalence in England 23-year prevalence by demographic and geographic measures.

Activity and need data by CCG. Cancer: Pancreatic (Inpatient).

Activity ratio is per 100 need

Hepatobiliary and Pancreas (Outpatient)

Activity data - Outpatient attendances with (IR flag 19Z) Hepatobiliary and Pancreas (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this prescribed service line as it covers a wide range of treatment conditions (and associated procedures). We have therefore used the General and acute weighted CCG population as a proxy for need in this instance.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

Activity and need data by CCG. Hepatobiliary and Pancreas (Outpatient).

Activity ratio is per 1,000 need

4.1.3 Specialised Endocrinology

There was just one service line within the Specialised Endocrinology category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. This was:

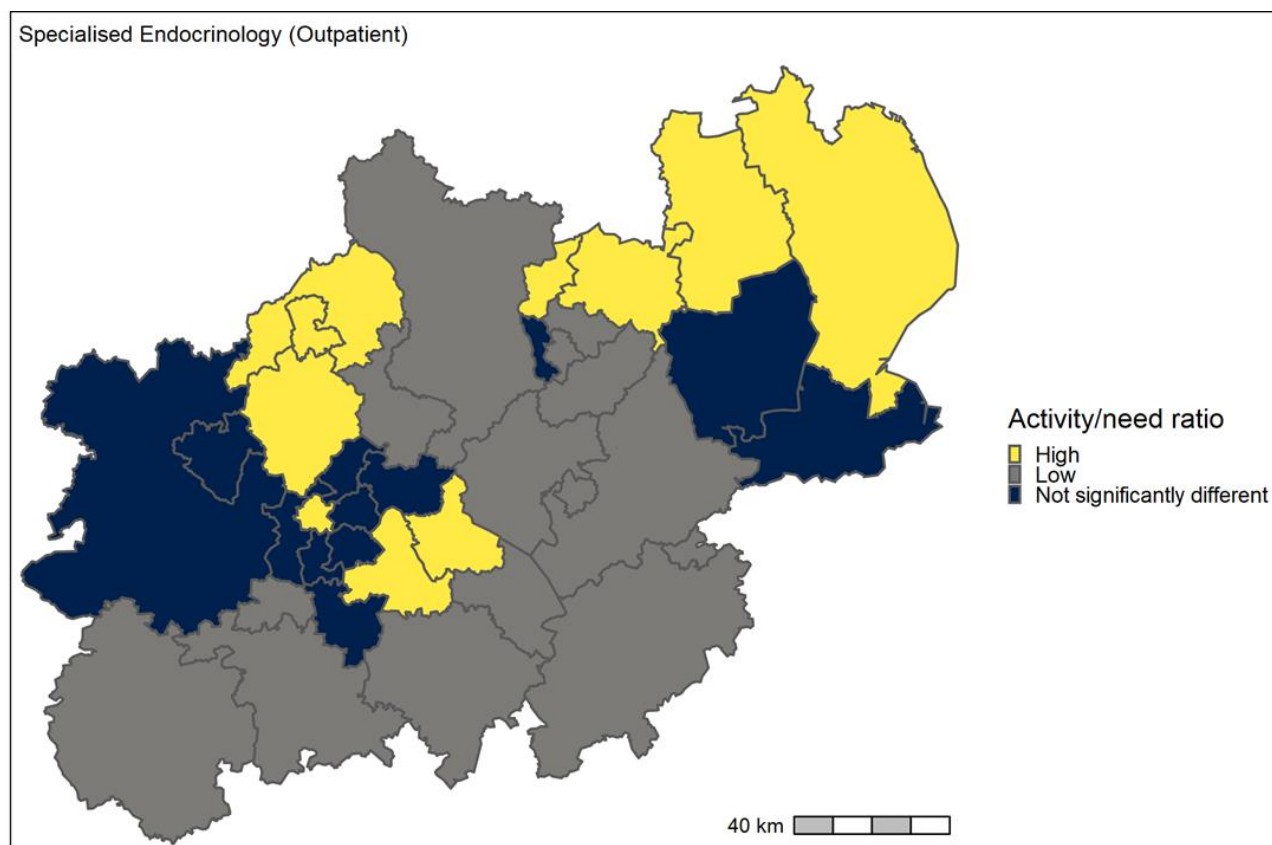

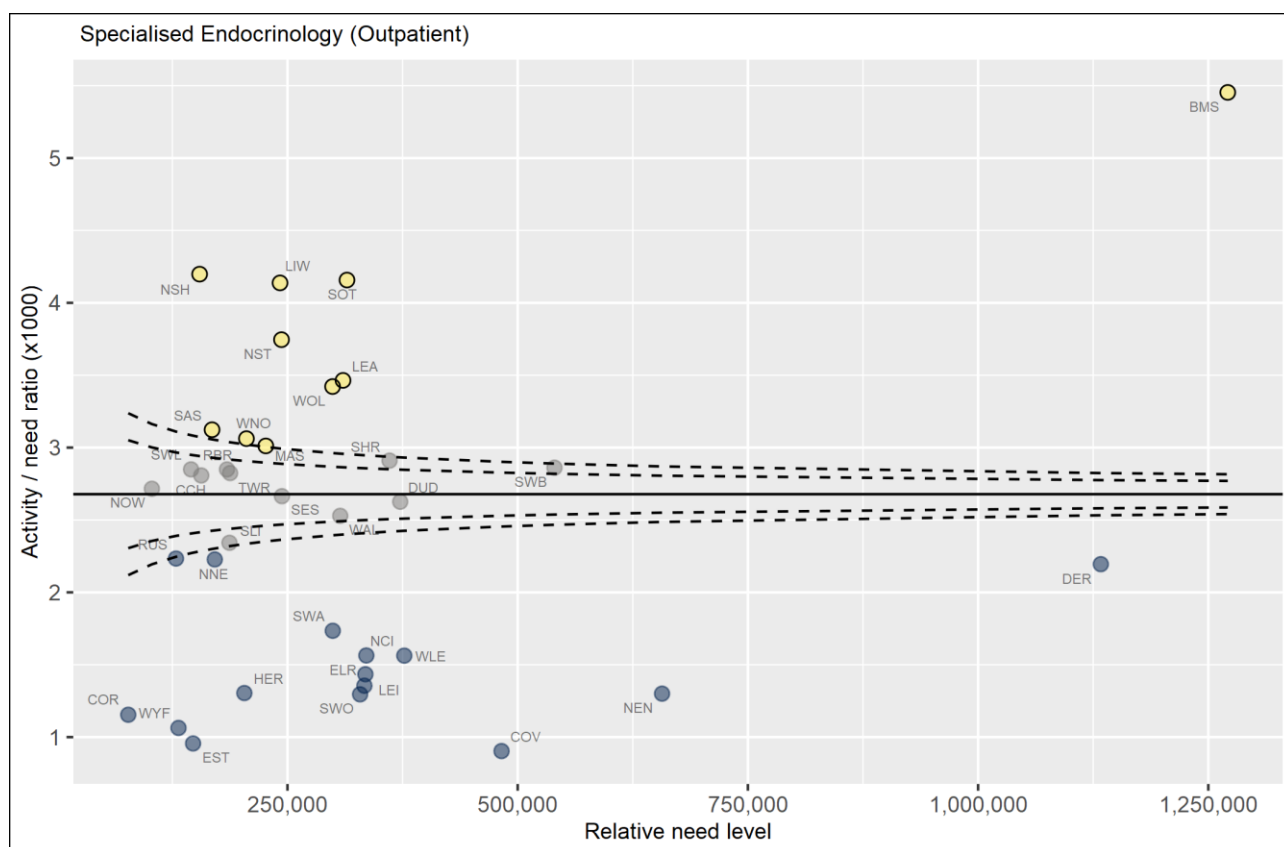

- Endocrinology (outpatient).

Endocrinology (Outpatient)

Activity data - Outpatient attendances with (IR flag 27Z) Endocrinology plus attendances with the NPoC CRG code AO3 (Specialised Endocrinology) but did not have a prescribed service line code recorded.

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line as it covers a wide range of treatment conditions related to the endocrine glands and hormones. We have therefore used the General and acute weighted CCG population as a proxy for need in this instance.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

4.1.4 Vascular Disease

There was just one service line within the Vascular Disease category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. This was:

- Vascular Disease (outpatient).

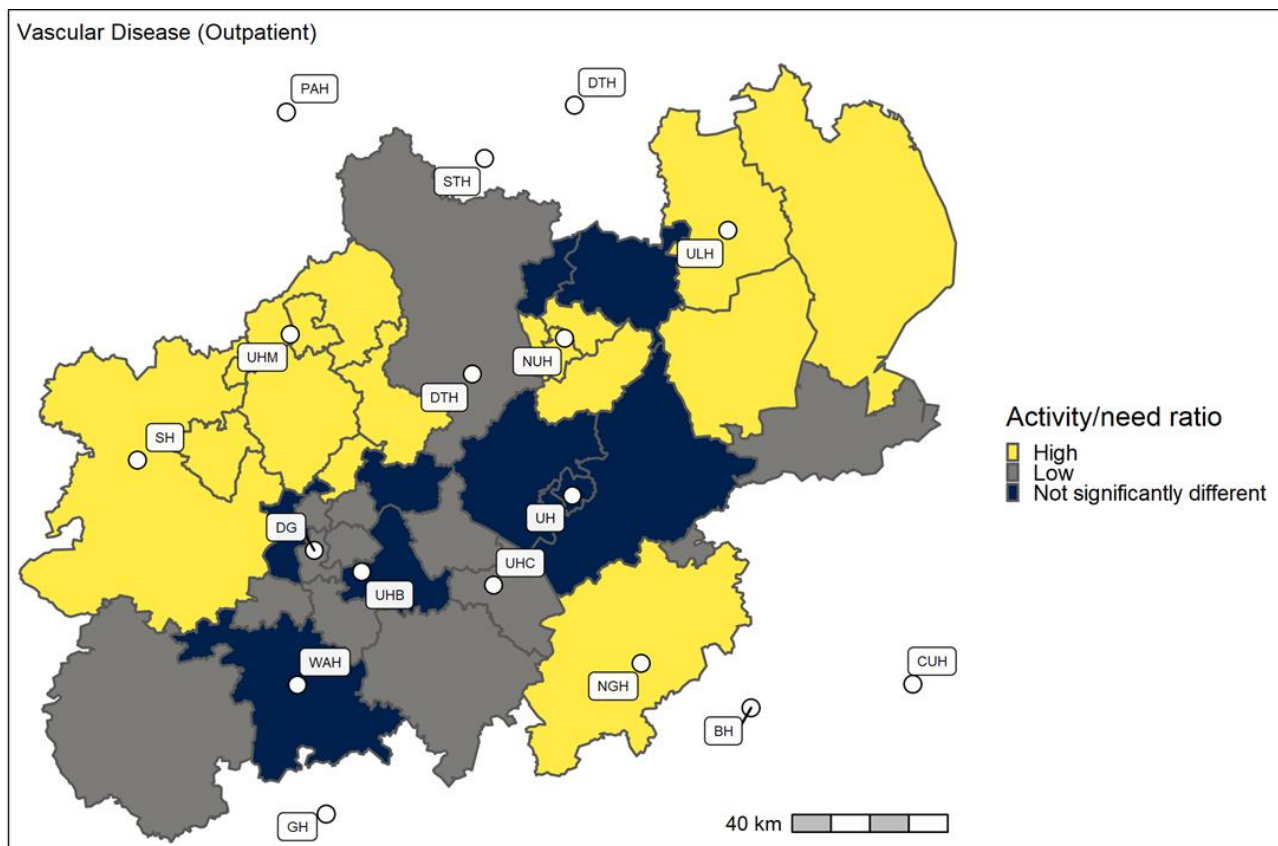

Vascular Disease (Outpatient)

Activity data - Outpatient attendances with (IR flag 27Z) Vascular Disease (2018/19) plus attendances that NPoC CRG code AO4 (Vascular Disease) but did not have a prescribed service line code recorded.

Indicative level of need – QOF prevalence for peripheral arterial disease (2018/19)⁹.

Limitations: QOF prevalence data may underestimate true population prevalence. Importantly this underestimation may vary by practice and by CCG such that a high utilisation rate for a CCG on this service line may reflect under recording of patients with the condition rather than a higher level of access.

⁹ NHS England (2019). Quality and Outcomes Framework 2018-19 Recorded disease prevalence, achievements, and exceptions Clinical Commissioning Group (CCG) level.

4.1.5 Cardiothoracic Services

There were four services lines within the cardiothoracic services category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were :

- Cardiology: pPCI and structural heart disease complex invasive cardiology (inpatient),
- Cardiac Surgery (inpatient),
- Cardiology: Cardiac Electrophysiology and Ablation Services and Specialised Cardiology (inpatient) and
- Cardiac Surgery (outpatient).

Cardiology: pPCI And Structural Heart Disease Complex Invasive Cardiology (Inpatient)

Activity data - Inpatient admissions with (IR flag 13F) Cardiology: pPCI and Structural Heart Disease Complex Invasive Cardiology (2018/19).

Indicative level of need – QOF prevalence for coronary heart disease (2018/19) ¹⁰. Activity under this service line relates to a number of complex heart surgery procedures typically angioplasty and heart repair procedures as such the prevalence of CHD is considered to be a reasonable proxy for need in this case that is better than a general indicator of need such as the weighted population.

Limitations: QOF prevalence data may underestimate true population prevalence. Importantly this underestimation may vary by practice and by CCG such that a high utilisation rate for a CCG on this service line may reflect under recording of patients with the condition rather than a higher level of access.

Cardiac Surgery (Inpatient)

Activity data - Inpatient admissions with (IR flag 13E) Cardiac Surgery (2018/19).

Indicative level of need – QOF prevalence for coronary heart disease (2018/19) ¹¹. Activity under this service line includes all activity with a treatment specialty of cardiac or cardiothoracic surgery. Whilst this may include activity resulting from conditions other than CHD the prevalence of CHD is considered to be a reasonable proxy for need in this case that is better than a general indicator of need such as the weighted population.

Limitations: QOF prevalence data may underestimate true population prevalence. Importantly this underestimation may vary by practice and by CCG such that a high utilisation rate for a CCG on this service line may reflect under recording of patients with the condition rather than a higher level of access.

¹¹ NHS England (2019). Quality and Outcomes Framework 2018-19 Recorded disease prevalence, achievements and exceptions Clinical Commissioning Group (CCG) level.

Cardiology: Cardiac Electrophysiology and Ablation Services (Inpatient)

Activity data - Inpatient admissions with (IR flag 13B) Cardiac Electrophysiology and Ablation Services (2018/19).

Indicative level of need – QOF prevalence for coronary heart disease (2018/19) ¹². Activity under this service line relates to cardiac electrophysiology and ablation services as such the prevalence of CHD is considered to be a reasonable proxy for need in this case that is better than a general indicator of need such as the weighted population.

Limitations: QOF prevalence data may underestimate true population prevalence. Importantly this underestimation may vary by practice and by CCG such that a high utilisation rate for a CCG on this service line may reflect under recording of patients with the condition rather than a higher level of access.

4.1.6 Renal Services

There are four services lines within the Renal services category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were:

- Access for dialysis (inpatients and Outpatients) and
- Renal transplant (inpatients and Outpatients).

In this case we grouped the two service lines together.

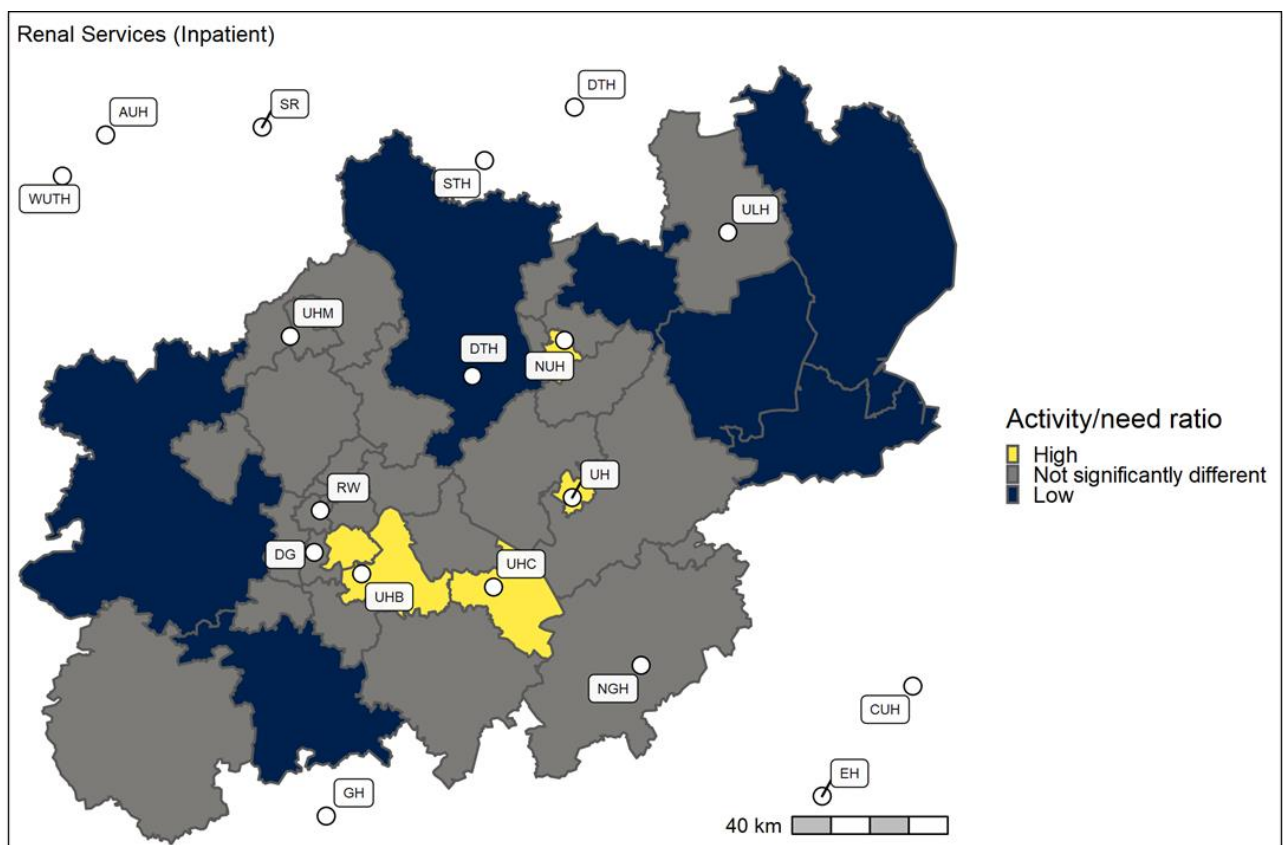

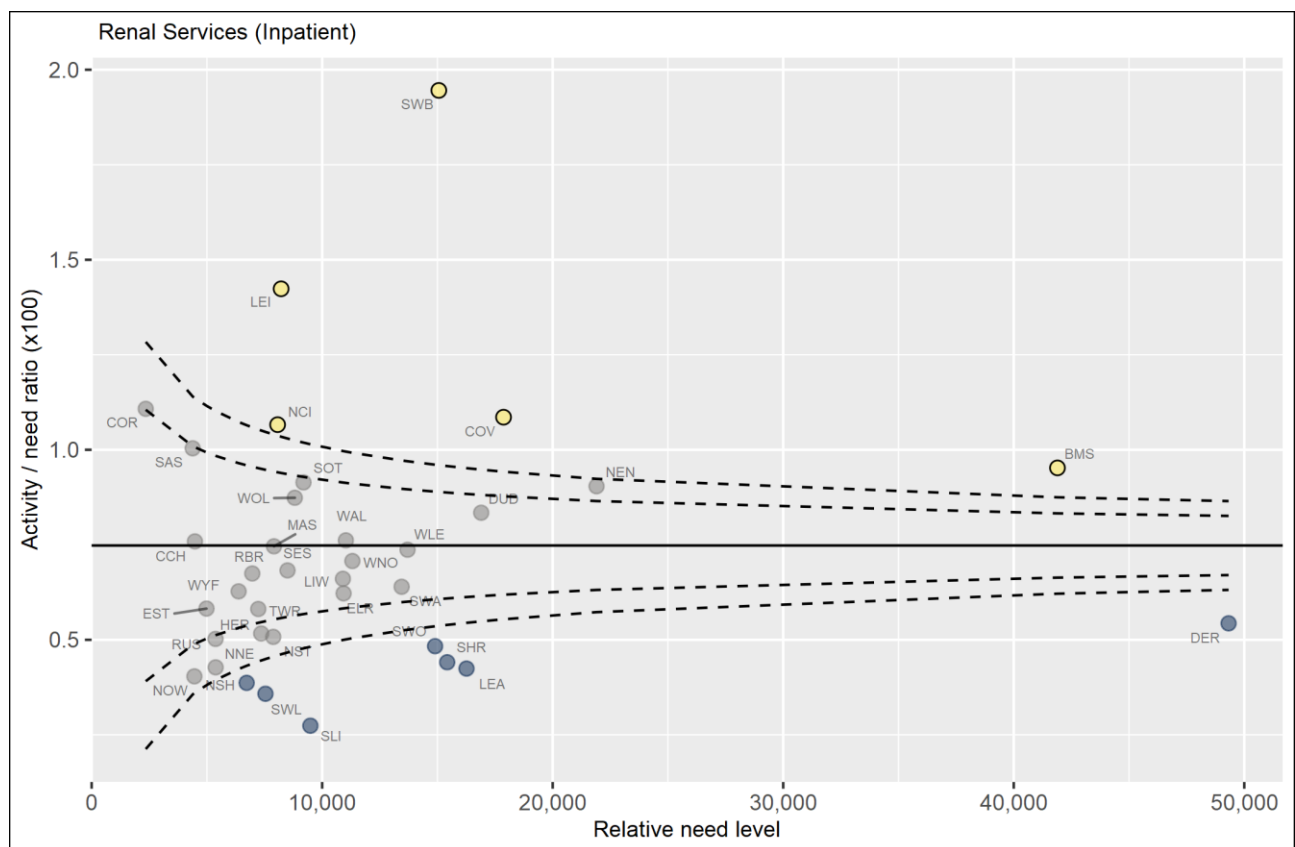

Dialysis and Renal transplant (inpatients)

Activity data - Inpatient admissions with (IR flag 11C Access for dialysis or 11T Renal transplant)

Indicative level of need - QOF prevalence for chronic kidney disease (2018/19) ¹⁴. Activity under this service line relates to a number of renal services procedures as such the prevalence of CKD is considered to be a reasonable proxy for need in this case that is better than a general indicator of need such as the weighted population.

Limitations: QOF prevalence data may underestimate true population prevalence. Importantly this underestimation may vary by practice and by CCG such that a high utilisation rate for a CCG on this service line may reflect under recording of patients with the condition rather than a higher level of access.

4.1.7 Specialised Colorectal Services

There are four service lines within the Specialised Colorectal subcategory. In this case in order to reach the threshold of 1500 for inclusion it was decided to consider the activity at subcategory level rather than service line.

Activity data - Inpatient admissions within the NPoC subcategory AO7 (Specialised Colorectal Services) (2018/19).

Indicative level of need - A directly related indicator or quantification of need could not be found for this activity subcategory as it covers a wide range of treatment conditions (and associated procedures). We have therefore used the General and acute weighted CCG population as a proxy for need in this instance.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

Activity and need data by CCG. Specialised Colorectal Services (Inpatient).

4.1.9 Specialised Rheumatology

There is just one service line within the Specialised rheumatology subcategory.

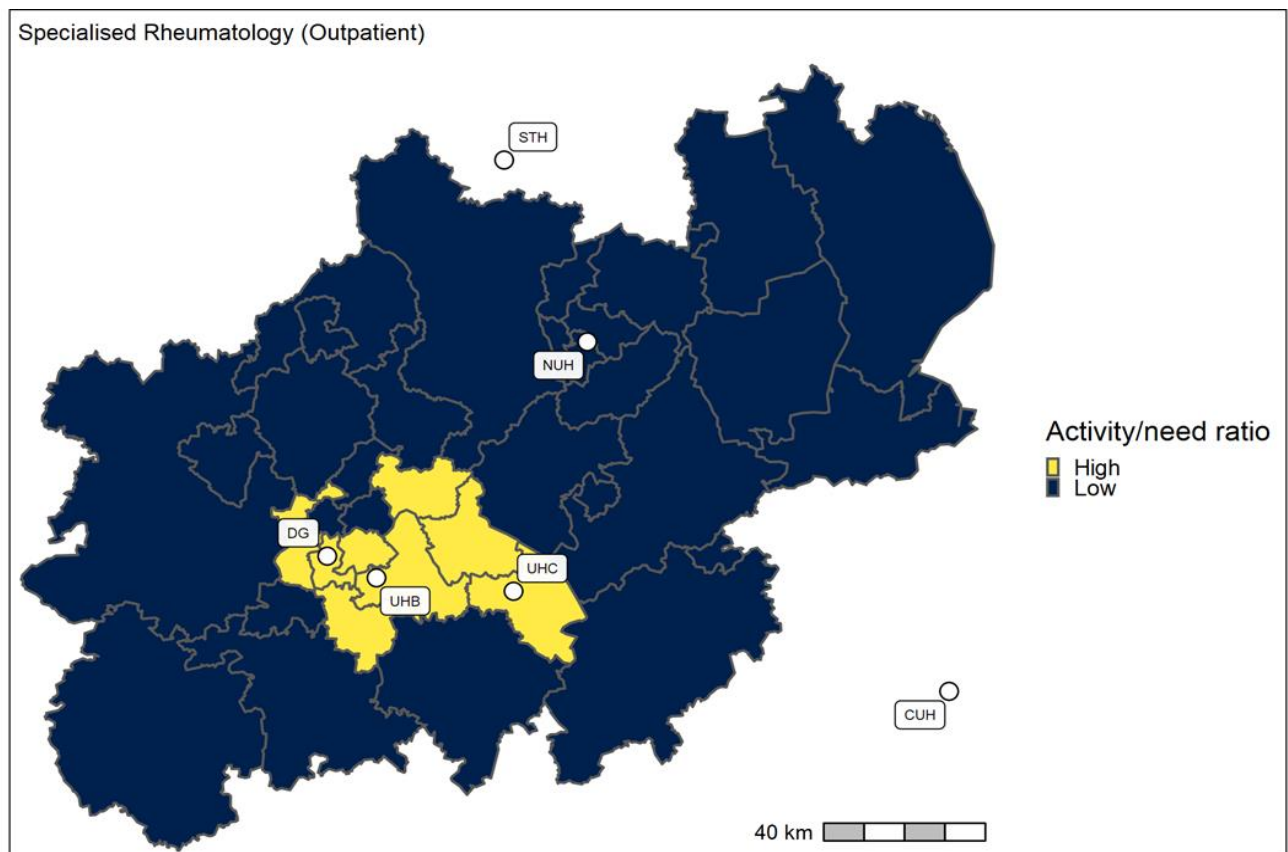

Rheumatology (Outpatient)

Activity data - Outpatient attendances with (IR flag 26Z) Specialised Rheumatology plus attendances with NPoC CRG code AO9 (Specialised Rheumatology) which did not have a prescribed service line code recorded.

Indicative level of need – QOF prevalence for rheumatoid arthritis (2018/19)¹⁷. Activity under this service line relates to a number of rheumatology procedures as such the prevalence of RA is considered to be a reasonable proxy for need in this case that is better than a general indicator of need such as the weighted population.

Limitations: QOF prevalence data may underestimate true population prevalence. Importantly this underestimation may vary by practice and by CCG such that a high utilisation rate for a CCG on this service line may reflect under recording of patients with the condition rather than a higher level of access.

¹⁷ NHS England (2019). Quality and Outcomes Framework 2018-19 Recorded disease prevalence, achievements and exceptions Clinical Commissioning Group (CCG) level.

4.2 Cancer

4.2.1 Specialised Cancer

There are nine services lines (or grouped service lines) within the Specialised Cancer category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were:

- Cancer: Brain and Central Nervous System (combined with Stereotactic radiosurgery),
- Cancer: Head and Neck (Inpatient),
- Cancer: Testicular (Inpatient),
- Complex Thoracic Surgery (Inpatient),
- Cancer: Urological - exc. testicular (Inpatient) (combination of Urology – Penile Prosthetics Surgery, Cancer: Urology - Surgical Sperm Removal, Urethral Reconstruction Surgery, Cancer: Specialised Kidney, Bladder and Prostate. Cancer: Penile),
- Cancer: Upper gastrointestinal tract (Inpatient) (combination of Cancer: Oesophageal and Gastric Cancer and Oesophageal Gastric (Electrostimulation)),
- Cancer: Gynaecological (Inpatient),
- Rare Cancers – Adults (inpatients), Thoracic Surgery (Outpatient)

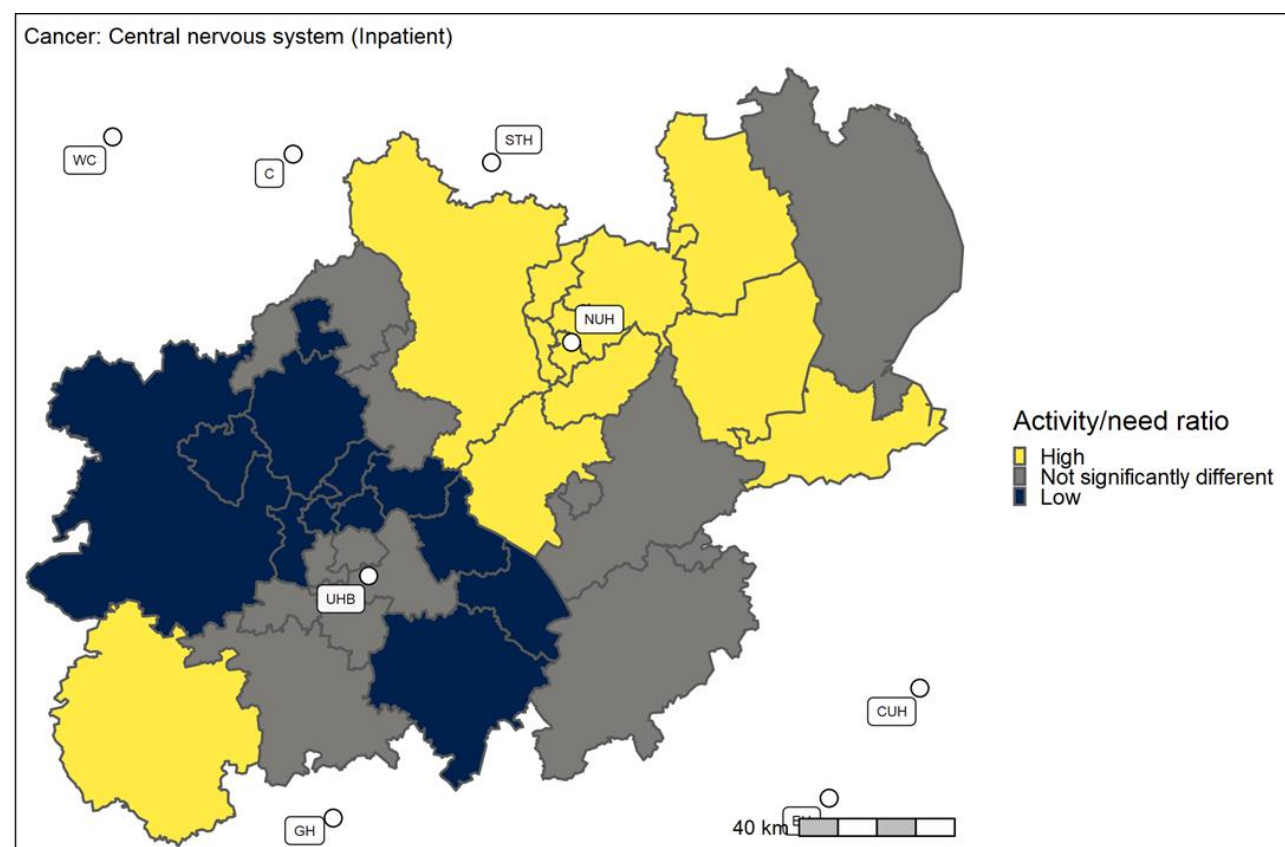

Cancer: Central nervous system (Inpatient)

Activity data - Inpatient admissions with IR flag 01Q (Cancer: Brain and Central Nervous System) or 01S (Stereotactic radiosurgery) in 2018/19.

Indicative level of need - Cancer Prevalence of Brain, meningeal and other primary CNS tumours (Public Health England¹⁸).

Limitations: Prevalence in this instance counts the number of people alive at 31/1/2017 who had had a cancer diagnosis. Therefore, it is not a direct measure of current need for services but it should still provide a reasonable proxy for the overall level of need for an area.

¹⁸ Public Health England and NHS (2018). Cancer Prevalence in England 23 year prevalence by demographic and geographic measures.

Activity and need data by CCG. Cancer: Central nervous system (Inpatient).

Cancer: Testicular (Inpatient)

Activity data - Inpatient admissions with IR flag 01Z (Cancer: Testicular) in 2018/19.

Indicative level of need - Cancer Prevalence: Testicular tumors, including post-pubertal teratomas (Public Health England 2020).

Limitations: Prevalence in this instance counts the number of people alive at 31/1/2017 who had previously had a cancer diagnosis. Therefore, this is not a direct measure of current need for services, but it should still provide a reasonable proxy for the overall level of need for an area.

Complex Thoracic Surgery (Inpatient)

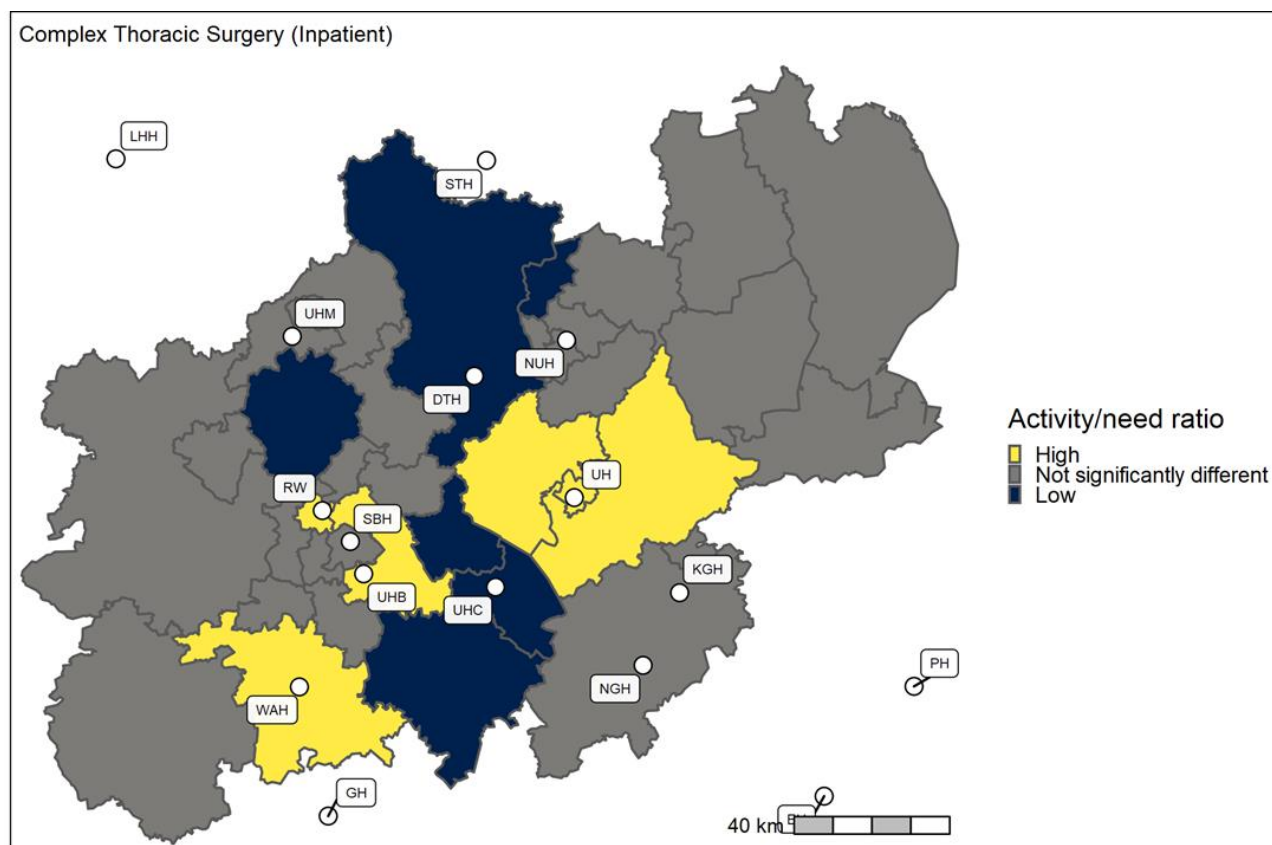

Activity data - Inpatient admissions with IR flag 29B (Complex Thoracic Surgery) in 2018/19.

Indicative level of need - Cancer Prevalence: Lung, trachea and bronchus (Public Health England 2021).

Limitations: Prevalence in this instance counts the number of people alive at 31/1/2017 who had previously had a cancer diagnosis. Therefore, this is not a direct measure of current need for services, but it should still provide a reasonable proxy for the overall level of need for an area.

NOTE: Although this service line falls under the NPoC of Specialised Cancer the treatment functions used to identify episodes within this service line are Thoracic surgery and cardiothoracic surgery which in some (if not many) cases will not be directly related to cancer. Cancer prevalence may not therefore be the most appropriate indicator of need.

Rare Cancers - Adults

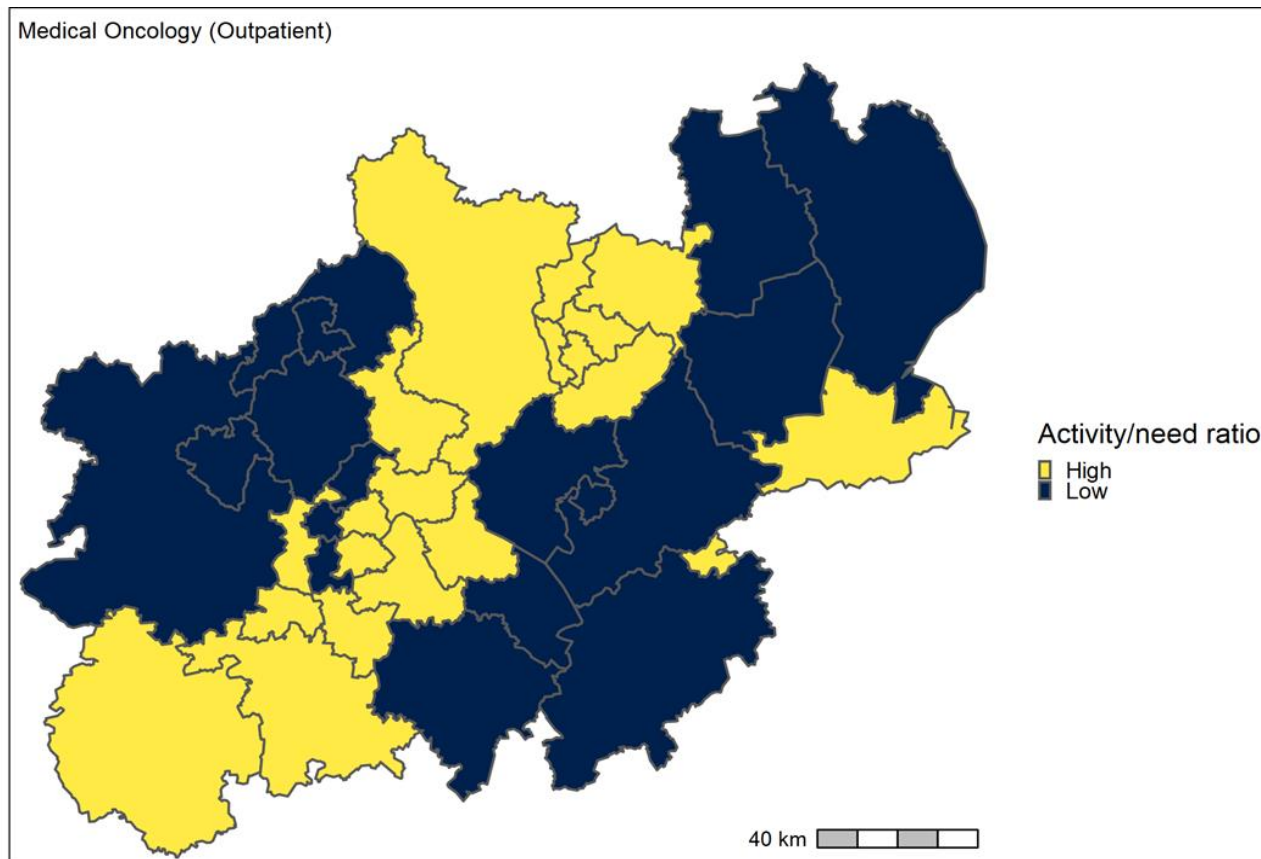

The service line 01Y (Rare Cancers) appears to include attendances for chemotherapy and radiotherapy. According to the treatment function codes, the volumes of outpatient activity recorded were 248,192 in Medical Oncology and 490,461 in Clinical Oncology (previously Radiotherapy) and 250 in Paediatric Medical Oncology. It was decided that this service line would be split according to the treatment function.

Medical Oncology (outpatient)

Activity data- Outpatient attendances with (IR flag 01Y) Rare Cancers – Adults and treatment function code 370 (Medical oncology) (2018/19).

Indicative level of need – Given that this service line typically includes chemotherapy attendances for all types of cancer, the indicator of need applied in this case is the sum of all the cancer in the prevalence data produced by Public Health England and NHS in 2018²⁵.

²⁵ Public Health England and NHS (2018). Cancer Prevalence in England 23 year prevalence by demographic and geographic measures.

Activity and need data by CCG. Rare Cancers – Medical Oncology (Outpatient).

Thoracic Surgery (Outpatient)

Activity data - Outpatient attendances with (IR flag 29Z) Thoracic Surgery (2018/19). Even though this category is under the NPoC of Cancer, the activity recorded in this prescribed service line covers a range of different diagnoses which includes but not exclusively cancer; for example, the service line also covers pyothorax without fistula, other spontaneous pneumothorax and multiple fractures of ribs closed.

Indicative level of need – A directly related indicator or quantification of need could not be found for this prescribed service line as it covers a wide range of health problems. We have therefore used the General and acute weighted CCG population as a proxy for need in this instance.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

Activity and need data by CCG. Thoracic Surgery (Outpatient).

4.2.2 Children and Young Adult Cancer Services

There are four services lines within the Children and Young Adult Cancer category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were Cancer: Teenage and young adults (inpatient and outpatient) and Paediatric Oncology (Inpatients and outpatients)

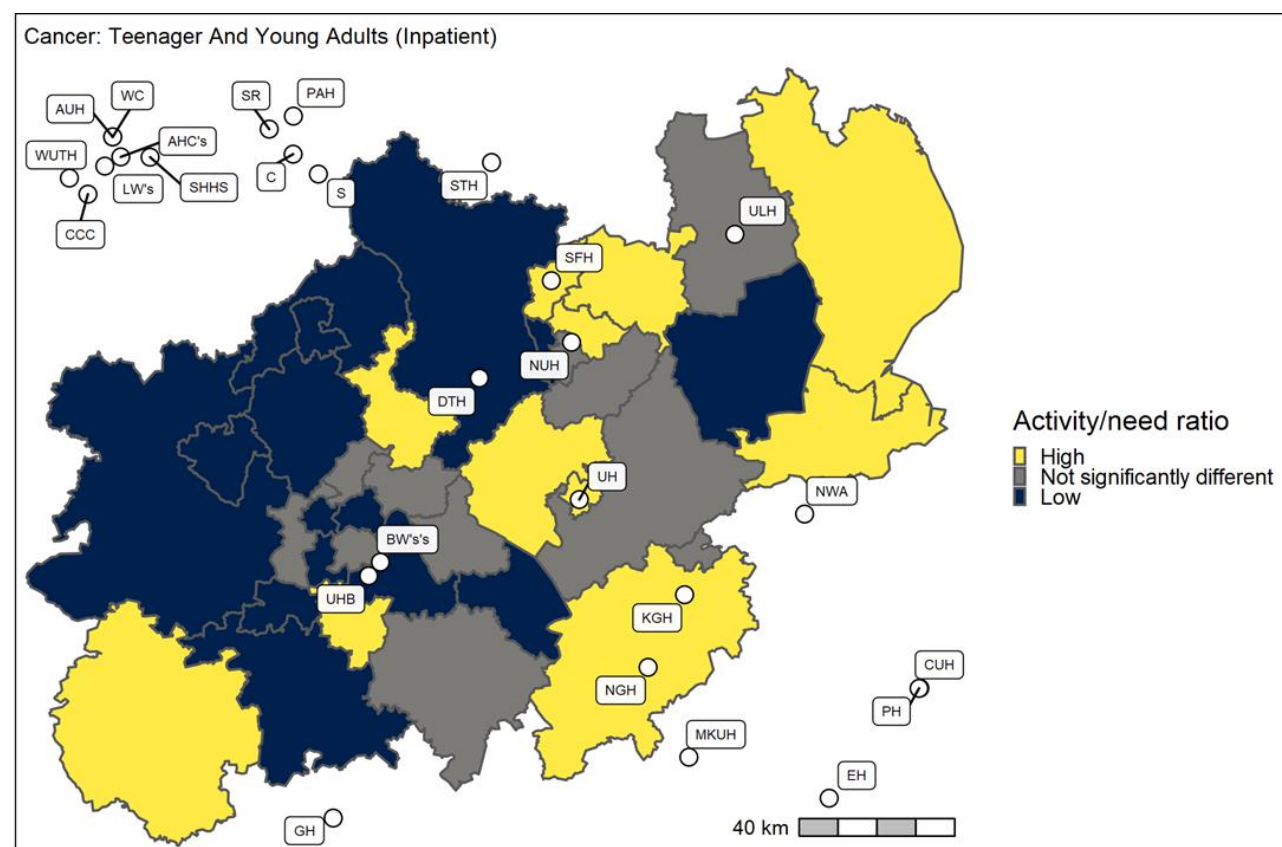

Cancer: Teenager and Young Adults (inpatients)

Activity data – Inpatient admissions with (IR flag 01T) Cancer: Teenager and Young Adults (2018/19).

Indicative level of need – 10 year Prevalence of cancer age group 15-24 years old. Source: Cancer Prevalence data Public Health England 2018²⁷.

Limitations: Prevalence in this instance counts the number of people alive at 31/1/2017 who had had a cancer diagnosis. Therefore, it is not a direct measure of current need for services but it should still provide a reasonable proxy for the overall level of need for an area. In addition, the age groups are slightly different (15-24 need source and 17-24 inpatient admissions).

²⁷ Public Health England and NHS (2018). Cancer Prevalence in England 23 year prevalence by demographic and geographic measures.

Activity and need data by CCG. Cancer: Teenager and Young Adults (Inpatient).

Paediatric Oncology (Outpatient)

Activity data - Outpatient attendances with (IR flag 23A) Paediatric Oncology (2018/19).

Indicative level of need – 10 year Prevalence of cancer age group 0-14 years old. Source: Cancer Prevalence data Public Health England 2018³⁰.

Limitations: Prevalence in this instance counts the number of people alive at 31/1/2017 who had had a cancer diagnosis. Therefore, it is not a direct measure of current need for services, but it should still provide a reasonable proxy for the overall level of need for an area.

³⁰ Public Health England and NHS (2018). Cancer Prevalence in England 23 year prevalence by demographic and geographic measures.

Activity and need data by CCG. Paediatric Oncology (Outpatient).

4.3.2 Spinal Services

There was just one service lines within the Spinal services category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. This was Spinal Cord Injury (outpatient).

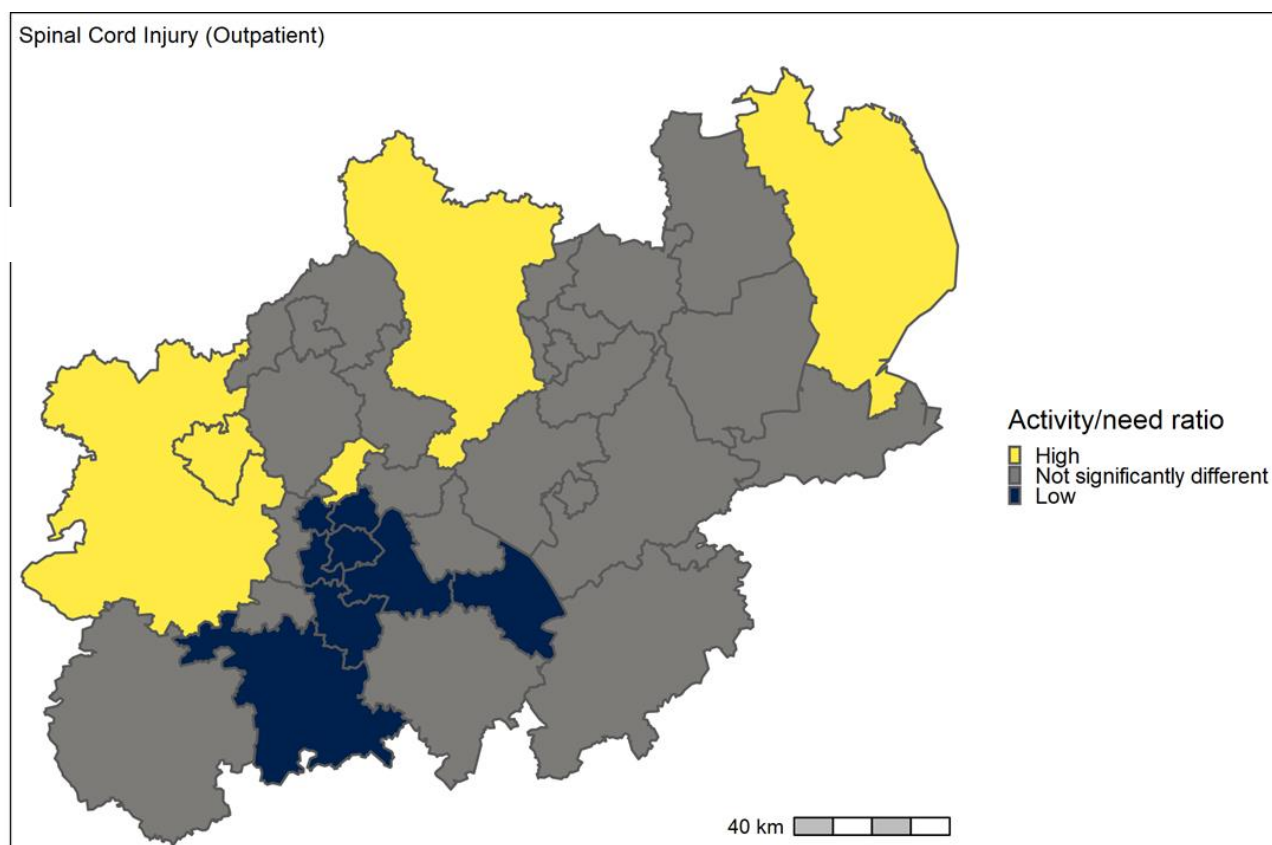

Spinal Cord Injury (Outpatient)

Activity data - Outpatient spells with (IR flag 06A) Spinal Cord Injury (2018/19).

Indicative level of need – Age specific Incidence rates of traumatic spinal cord injury in Scotland 2009-2013 were applied to CCG populations. Source: Changing demographics of spinal cord injury over a 20-year period³¹.

Limitations: The incidence data used to derive the need indicator is now several years old and relates to Scotland but nevertheless should provide a reasonable proxy for need.

³¹ McCaughey, E., Purcell, M., McLean, A. et al. (2016). Changing demographics of spinal cord injury over a 20-year period: a longitudinal population-based study in Scotland. *Spinal Cord*. 54, 270–276.

4.3.3 Neurosciences

There were five service lines within the Neurosciences category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were Neurology (inpatient and outpatient), Neurophysiology (outpatient) and Neurosurgery (inpatient and outpatient).

Neurology (Inpatient)

Activity data – Inpatient spells with (IR flag 08O) Neurology (2018/19).

Indicative level of need – Activity within the Neurology service line includes a range of conditions and procedures so there is no single comprehensive estimate of need for this service line. However, 44% of the activity within this service line is coded as Demyelinating diseases (incl. Multiple Sclerosis) of the CNS. Therefore, our view is that the prevalence of Multiple Sclerosis is a better proxy for need in this case than population based proxy. Age specific prevalence estimates of MS were applied to CCG populations

Activity and need data by CCG. Neurology (Inpatient).

Neurology (Outpatient)

Activity data - Outpatient spells with (IR flag 08O) Neurology (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this prescribed service line as it covers a wide range of treatment conditions (and associated procedures). Diagnosis coding in outpatient dataset is poor and as such it was not possible to identify an proxy indicator of need based on prevalent conditions within this service line (as in the corresponding inpatient service line). We have therefore used the General and acute weighted CCG population as a proxy for need in this instance.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

Neurosurgery (Inpatient)

Activity data - Inpatient spells with (IR flag 08S) Neurosurgery (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this prescribed service line as it covers a wide range of treatment conditions (and associated procedures). We have therefore used the General and acute weighted CCG population as a proxy for need in this instance.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

4.3.4 Specialised Ear and Ophthalmology Services

There were three service lines within the Specialised ear and Ophthalmology category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were Ophthalmology Adults (inpatient) and Ophthalmology Children (inpatient and outpatient).

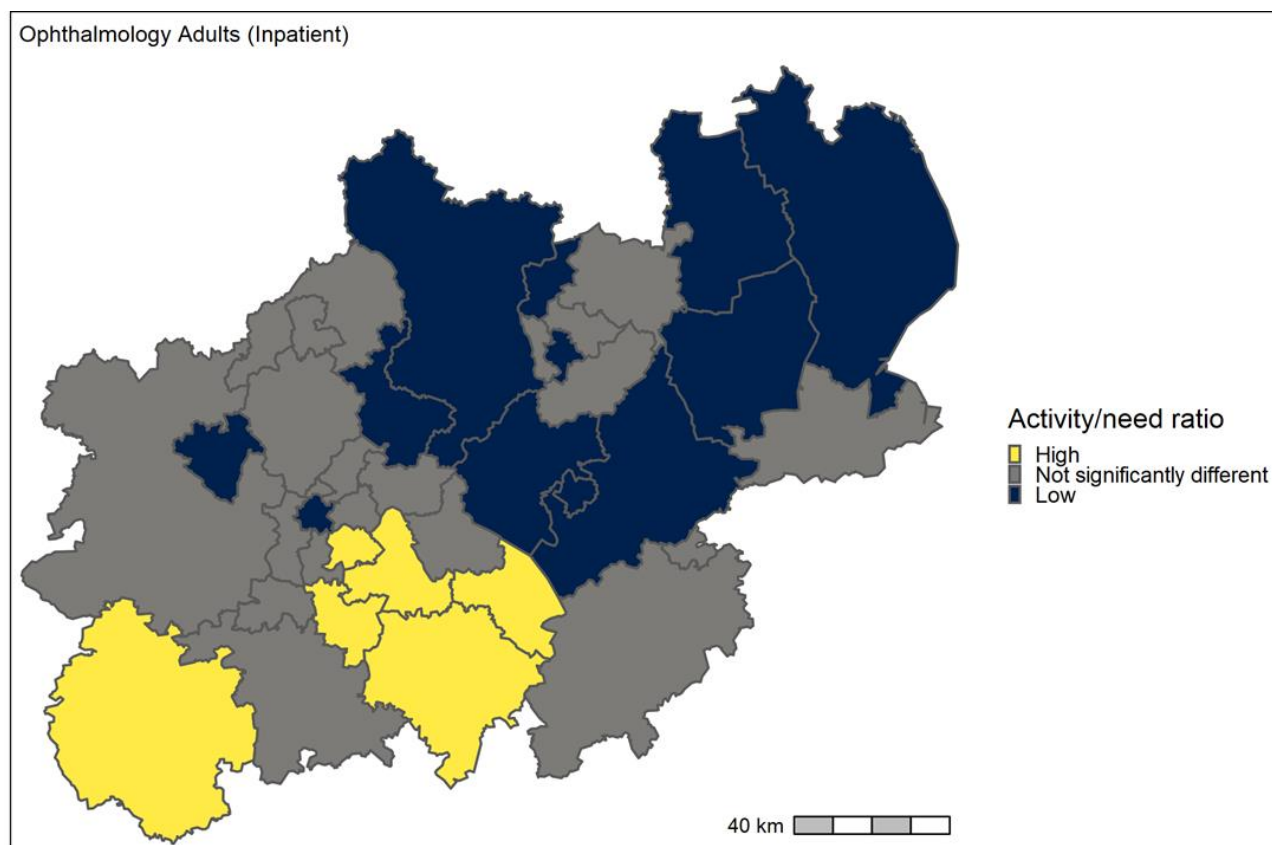

Ophthalmology Adults (Inpatient)

Activity data - Inpatient spells with (IR flag 37Z) Ophthalmology Adults (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line however as the prevalence of visual impairment increases significantly with age³². It was decided that the general and acute weighted population would be a good proxy for need.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

Ophthalmology Children (Inpatient)

Activity data - Inpatient spells with (IR flag 23N) Ophthalmology (Children) (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line as it covers a wide range of conditions and procedures. The 0-18 population estimates at CCG level³³ was used instead as a proxy for need.

Limitations: Population estimates by age group accounts for only for age. It is therefore considered a better indicator of need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

4.4 Women and children

There were sixteen service lines within the Women and Children activity category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis.

These were: are: Medical Genetics (outpatient), Children's Services – Trauma and Orthopaedics (inpatient), Children's Services – Surgery (inpatient and outpatient), Paediatric Medicine: Gastroenterology, Hepatology and Nutrition (inpatient and outpatient), Paediatric Medicine: Haematology (outpatient) Paediatric Medicine: Respiratory (inpatient and outpatient), Paediatric Medicine: Endocrinology and Diabetes (outpatient), Paediatric Medicine: Renal (inpatient and outpatient), Paediatric Medicine: Rheumatology (outpatient), Paediatric Neurosciences (inpatient and outpatient), Paediatric Cardiac (outpatient) and Congenital Heart Disease Adults (outpatient).

4.4.1 Medical Genetics

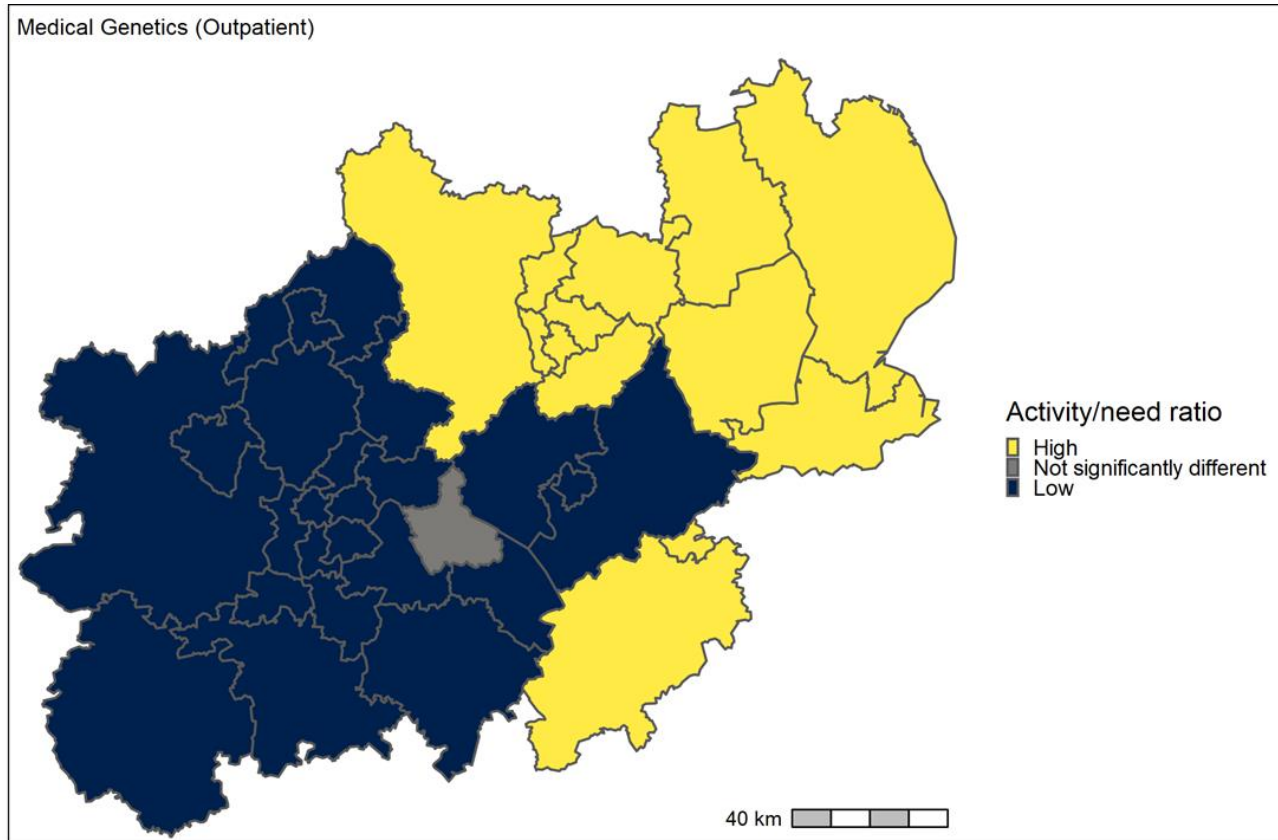

There is just one service line within the Medical Genetics category – Medical genetics (outpatients).

Medical Genetics (Outpatient)

Activity data - Outpatient attendances with (IR flag 20Z) Medical Genetics (2018/19).

Indicative level of need - A directly related indicator or quantification of need could not be found for this service line as it covers a wide range of conditions and procedures. However, 90% of the outpatient attendances in the financial year 2018/19 under this service line are for people who are 60 years old or less; source: SUS+. As such we have used the under 60 population as the indicator of need for this service line.³⁵

4.4.2 Specialised Surgery in Children

There were three service lines within this category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis: Children's Services – Trauma and Orthopaedics (Inpatient), Children's Services – Surgery (inpatient and outpatient),

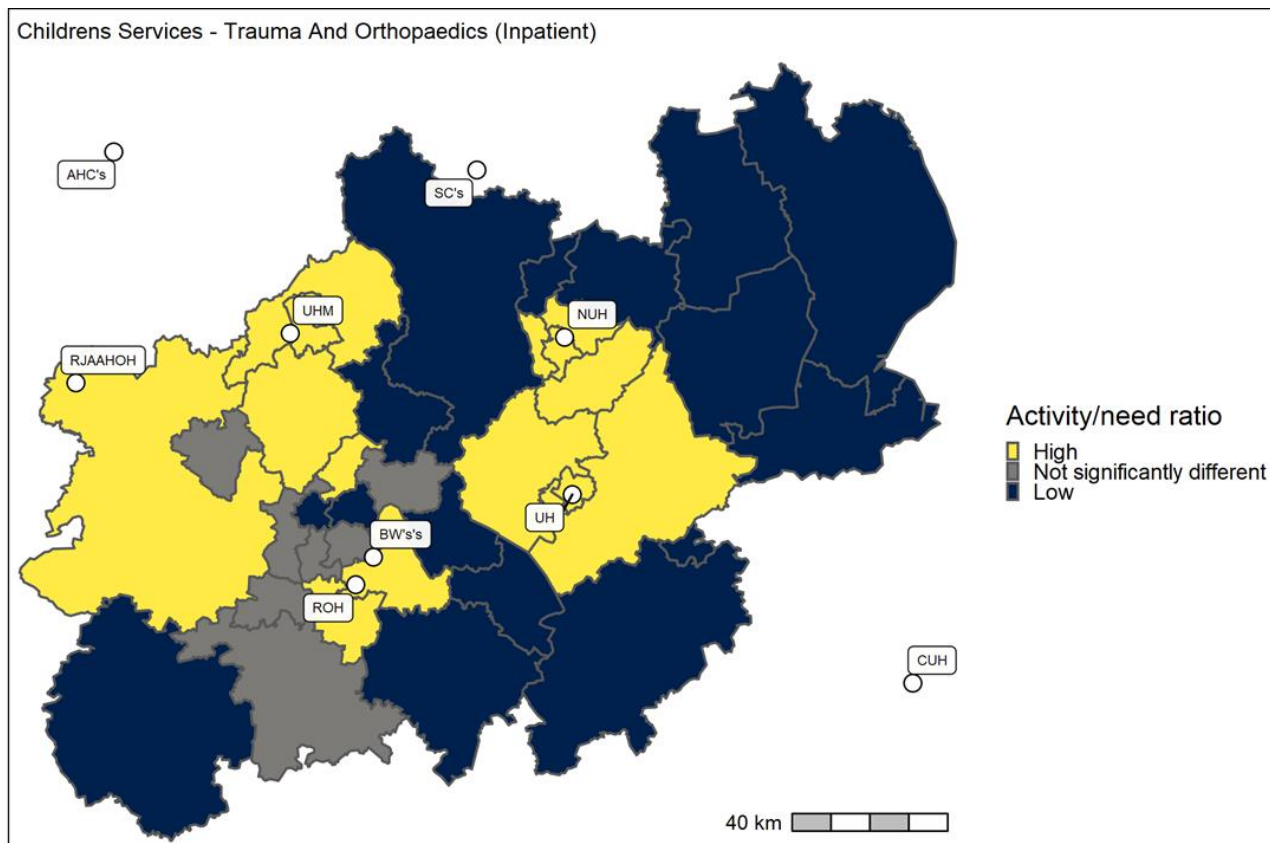

Children's Services – Trauma and Orthopaedics (Inpatient)

Activity data - Inpatient admissions with (IR flag 23Q) Children's Services – Trauma and Orthopaedics (2018/19).

Indicative level of need –Hospital admissions caused by unintentional and deliberate injuries in children (aged 0-14 years) in the financial year 2018/19. Source: Child Health Profiles published by Public Health England³⁶.

Limitations: Need indicator only provides data of a population age of 14 years or under and the activity data captures an age population of 18 years or under.

³⁶ <https://fingertips.phe.org.uk/profile/child-health-profiles/data#page/6/gid/1938133228/pat/6/par/E12000004/ati/202/are/E06000015/iid/90284/age/26/sex/4>

Children's Services – Surgery (Inpatient)

Activity data - Inpatient admissions and outpatient attendances with (IR flag 23X) Children's Services – Surgery (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line as it covers a range of conditions. Since the age group of the service line is 18 or under, we have used the population estimates at CCG level of those inhabitants who are 18 or under at mid-2018³⁷.

Limitations: Population estimates by age group accounts for only for age. It is therefore considered a better indicator of need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

4.4.3 Paediatric Medicine

There were ten services line within the Paediatric Medicine category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were Paediatric Medicine: Gastroenterology Hepatology and Nutrition (inpatient and outpatient), Paediatric Medicine: Haematology (outpatient), Paediatric Medicine: Respiratory (inpatient and outpatient), Paediatric Medicine: Endocrinology and Diabetes (outpatient), Paediatric Medicine: Renal (inpatient and outpatient), Paediatric Medicine: Rheumatology (outpatient), Paediatric Medicine: Gastroenterology (inpatients).

Activity data - Inpatient admissions with (IR flag 23F) Gastroenterology Hepatology and Nutrition (2018/19).

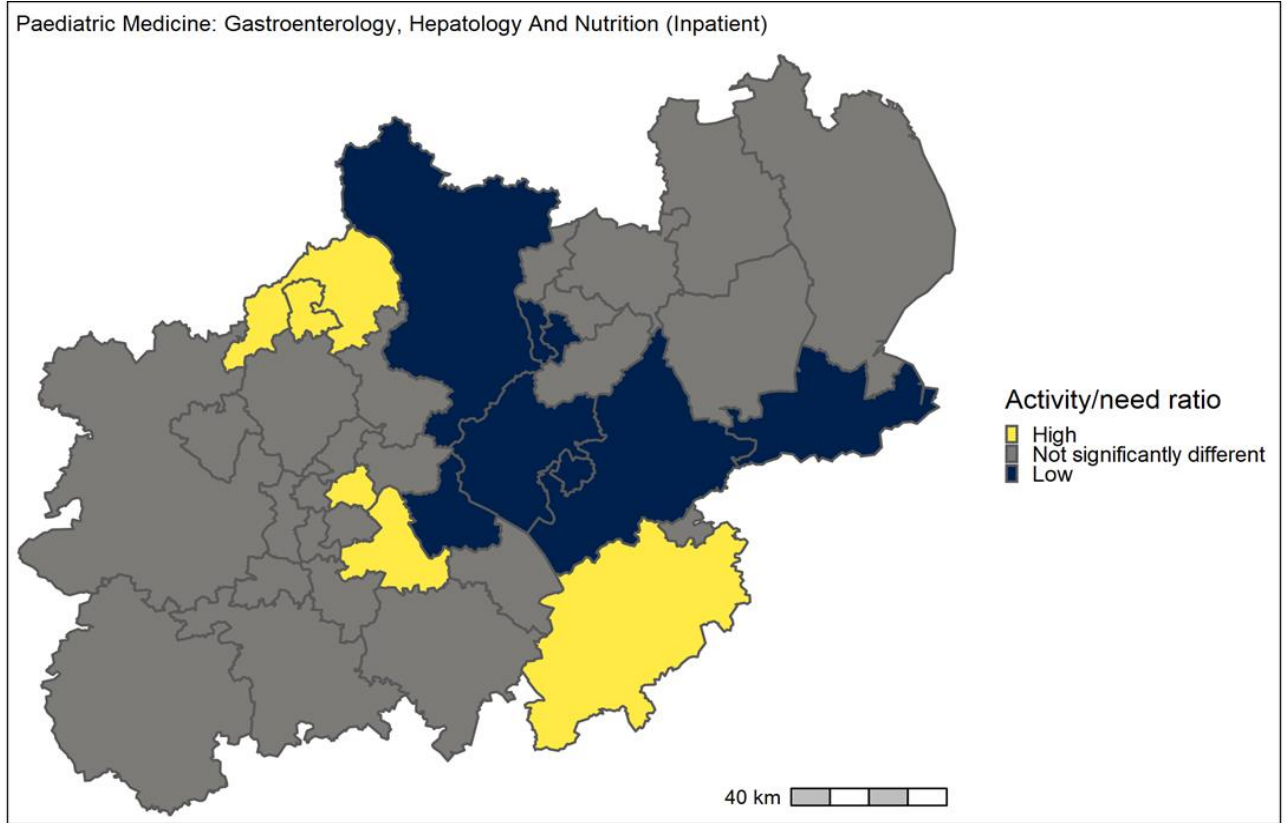

Indicative level of need – Prevalence of Digestive condition longstanding condition among children, by age and sex. Source: Health Survey for England (2018)³⁹. Age and sex specific prevalence figures are applied to CCG population estimates.

Prescribed service line	Longstanding condition
Gastroenterology, Hepatology and Nutrition	Digestive system
Haematology	Blood and related organs
Respiratory	Respiratory system
Endocrinology and Diabetes	Diabetes, other endocrine and metabolic
Renal	Genito-urinary system
Paediatric Medicine: Rheumatology	Musculoskeletal system

Limitations: The activity data is from patients who are 18 or under. The health survey only provides prevalence data up to 15 years. To account for this the prevalence of those aged between 10-15 was applied to the 16-18 population.

Activity data - Inpatient admissions with (IR flag 23T) Respiratory (2018/19).

Indicative level of need – Prevalence of longstanding Respiratory system conditions among children. Source: Health Survey for England (2018)⁴². Age and sex specific prevalence figures are applied to CCG population estimates.

Limitations: The activity data is from patients who are 18 or under. The health survey only provides prevalence data up to 15 years. To account for this the prevalence of those aged between 10-15 was applied to the 16-18 population.

Paediatric Neurosciences (Outpatient)

Activity data – Outpatient attendances with (IR flag 23M) Paediatric Neurosciences (2018/19).

Indicative level of need - Prevalence of longstanding mental, behavioural and neurodevelopmental conditions among children (Health Survey for England, 2018)⁴⁹. Age and sex specific prevalence figures are applied to CCG population estimates.

Limitations: The activity data is from patients who are 18 or under. The health survey only provides prevalence data up to 15 years. To account for this the prevalence of those aged between 10-15 was applied to the 16-18 population.

⁴⁹ NHS Digital (2019). Health Survey for England 2018: Longstanding conditions. Table 9: Prevalence of longstanding conditions among children, by age and sex.

Congenital Heart Disease (Adults)

Activity data - Outpatient attendances with (IR flag 13X) Congenital Heart Disease - Adults (2018/19).

Indicative level of need – No source of need data has been found for Congenital Heart Disease (Adults). Approximately 90% of the Outpatient attendances in the financial year 2018/19 under this prescribed service line were under 65 years old; source: SUS+. Due to this and the fact that this service line targets patients who are 19 or above, we have used the CCG population between 19 and 65 years old as the proxy indicator of need in this case.

Activity and need data by CCG. Congenital Heart Disease - Adults (Outpatient).

4.5 Blood and Infection

There were seven service lines within the blood and infection activity category that had more than 1,500 inpatient admissions or outpatient attendances necessary for inclusion in this analysis. These were: Blood and Marrow Transplantation (outpatient), Haemophilia (outpatient), Sickle Cell (inpatient), Thalassaemia (inpatient), Allergy (outpatient), Immunology (inpatient and outpatient).

4.5.1 Blood and Marrow Transplantation

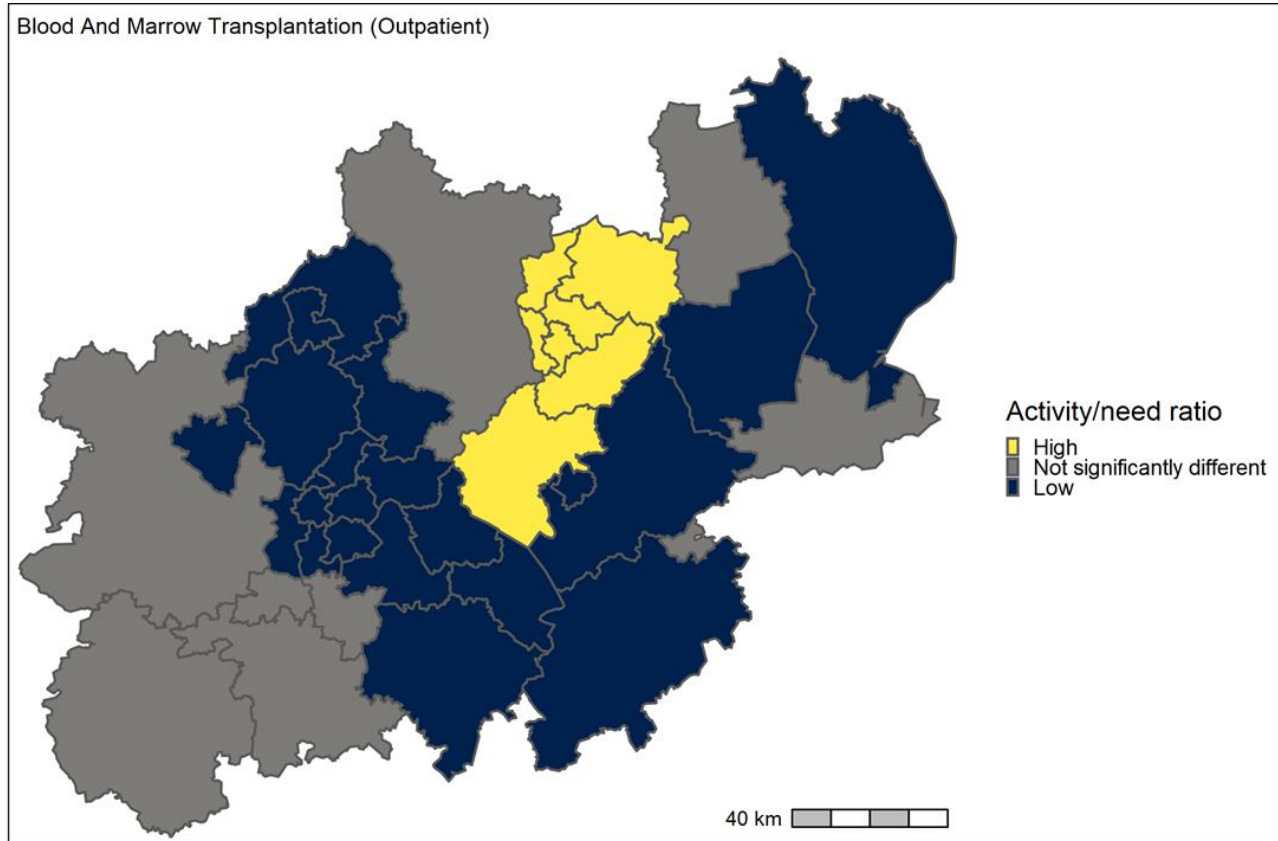

Blood and Marrow Transplantation (Outpatient)

Activity data - Outpatient spells with (IR flag 02Z) Blood and Marrow Transplantation (2018/19).

Indicative level of need – A directly related indicator or quantification of need data was not found for Blood and Marrow transplantation as the treatment is provided for a range of conditions. As the activity data for this service line in the financial year 2018/19 increases significantly with age⁵¹, the weighted population was used as a proxy for need.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

4.5.2 Specialised Blood Disorders

Haemophilia (Outpatient)

Activity data - Outpatient spells with (IR flag 03Z) Haemophilia (2018/19).

Indicative level of need – UK Age specific prevalence rates for Haemophilia (A and B) and Von Willebrand disease in the UK were calculated using data from an annual survey carried out by the World Federation of Haemophilia⁵². These were then applied to age specific populations within each CCG.

⁵² World Federation of Hemophilia. (2019). *Report on the Annual Global Survey 2018*.

4.5.3 Haemoglobinopathies

Sickle Cell (Inpatient)

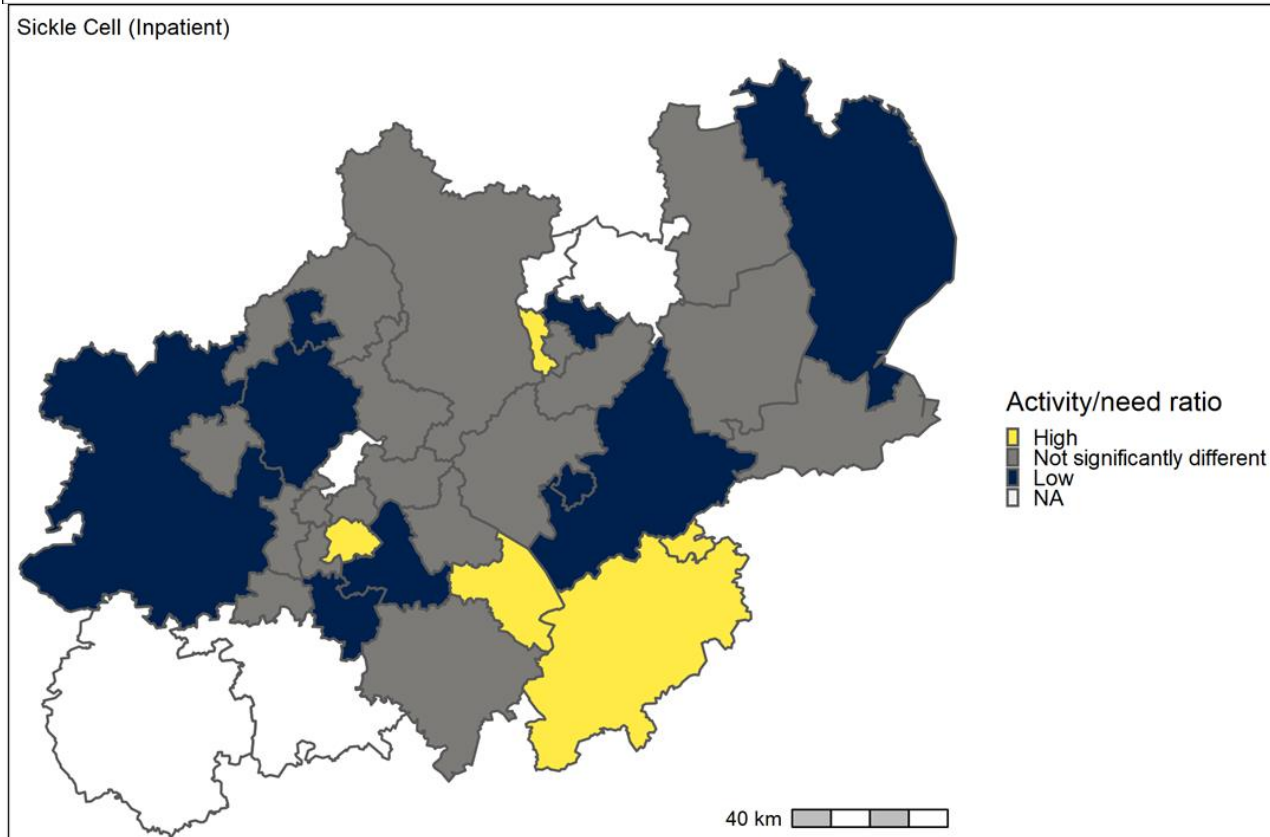

Activity data - Inpatient spells with (IR flag 38S) Sickle Cell (2018/19).

Indicative level of need – Sickle cell's prevalence is highly correlated with ethnicity; Black Africans are more likely to have the condition than other ethnicities⁵³. The ethnicity specific prevalence rates of this condition have been applied to each CCG's population by ethnicity.

Limitations: The population by ethnic group was obtained from 2016 and its geography was by local authorities⁵⁴. A mapping from local authorities to CCG was carried.

Thalassaemia (Inpatient)

Activity data - Inpatient spells with (IR flag 38T) Thalassaemia (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line. As approximately 90% of the spells were for patients aged between 0-40 years old (source: SUS+). The population at CCG-level aged below 40 years⁵⁵ was used as a proxy for need.

Limitations: Population estimates by age group accounts for only for age. It is therefore considered a better indicator of likely need than just the total population size but may not necessarily be an accurate indicator of need for this particular service line.

⁵⁵ Office for National Statistics (2019). Table SAPE21DT6a: Mid-2018 Population Estimates for Clinical Commissioning Groups (CCGs) in England by Single Year of Age and Sex - National Statistics.

4.5.4 Specialised Immunology and Allergy Services

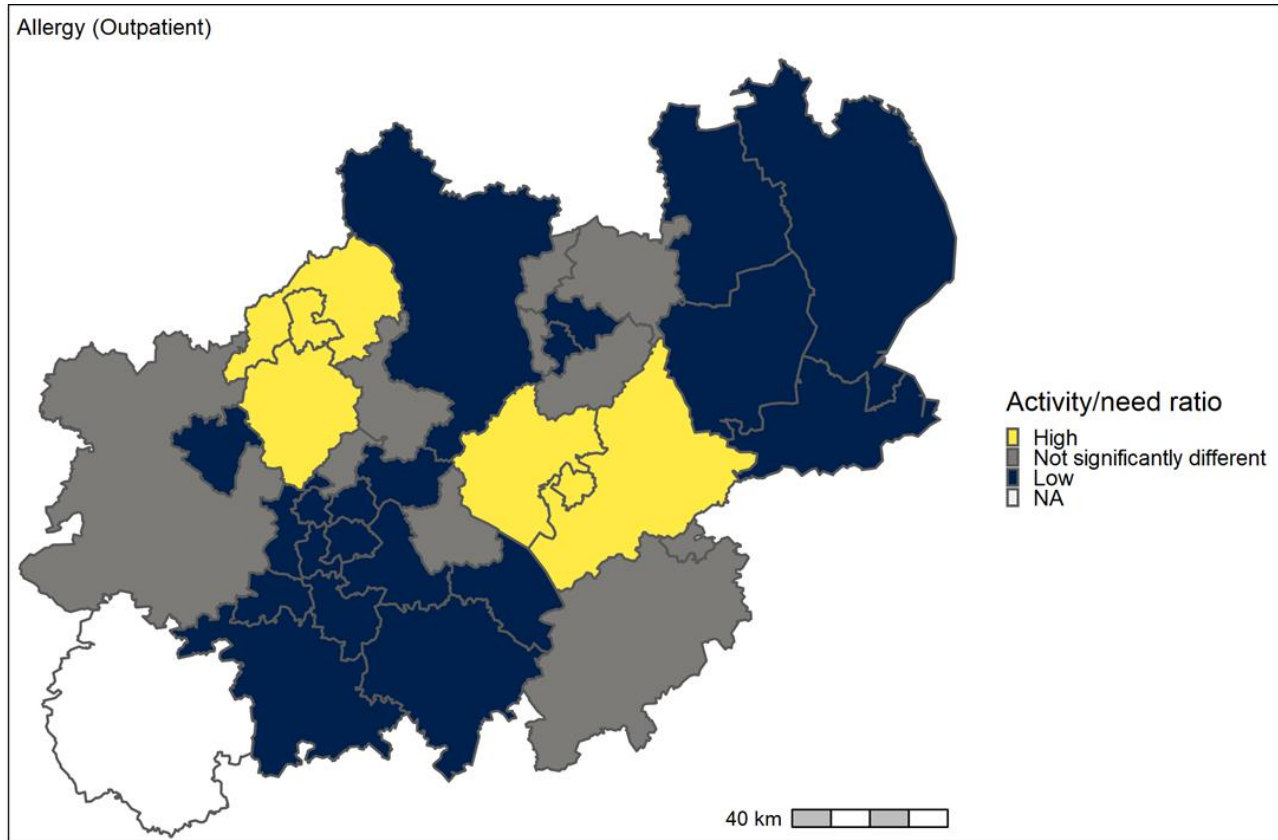

Allergy (Outpatient)

Activity data - Outpatient spells with (IR flag 17Z) Allergy (2018/19).

Indicative level of need – A directly related indicator or quantification of need could not be found for this service line. As most spells (around 90%) were for patients aged between 0-65 years old (source: SUS+) the CCG population aged below 65 years⁵⁶ was used as a proxy indicator of need.

Limitations: Population estimates by age group accounts for only for age. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.

⁵⁶ Office for National Statistics (2019). Table SAPE21DT6a: Mid-2018 Population Estimates for Clinical Commissioning Groups (CCGs) in England by Single Year of Age and Sex - National Statistics.

Immunology (Inpatient)

Activity data - Inpatient spells with (IR flag 16Z) Immunology (2018/19).

Indicative level of need – The activity for this service line increases with age. As such the weighted population was considered to be a reasonable proxy for need.

Limitations: The general and acute weighted population is a general indicator of overall healthcare need within a CCG. It is based on the CCG population but is adjusted to take account of a number of factors related to healthcare need such as age and gender. It is therefore considered a better indicator of likely need than just the overall population size but may not necessarily be an accurate indicator of need for this particular service line.
